NexusRAT — Command & Control (C#)

Hi everyone,

I'm excited to share the presentation video for my latest project, NexusRAT — a remote administration tool developed in C#.

In this video, I showcase the interface, core features, and overall structure of the project.

? Core Commands Overview
System Info – Retrieves general system information (OS, hardware, user)

Ping – Checks connectivity and latency

Whoami – Returns the current user

Disk Info – Shows disk usage and storage devices

? Monitoring & Interaction
Live Screen – Real-time screen streaming

Screenshot – Captures a snapshot of the desktop

? Remote Control
Remote Shell – Execute remote commands

Process Manager – Manage running processes

File Browser – Navigate the file system

? File Operations
File Transfer – Upload/download files

Upload – Send files to client

? Input & Data
Keylogger – Captures keystrokes

Get Clipboard – Retrieves clipboard content

Set Clipboard – Modifies clipboard content

? Miscellaneous
Open URL – Opens a URL on client machine

Show Message – Displays a message to the user

? System Control
Lock Screen – Locks the session

Restart – Reboots the system

Shutdown – Powers off the machine

Logoff – Logs out the user

? Client Management
Pin / Unpin – Prioritize a client

Uninstall Client – Removes the client

? Video Presentation [YouTube](#)

Feedback, suggestions, and ideas are always appreciated!

Thanks ?

Looks fine overall. The RAT gives off a bit of an Albuilt vibe, The most important thing will be stability and keeping everything running smoothly . Hard to judge that without seeing it in action, but on paper it looks good.

4chan.org/bl - April 20, 2026, 9:26 pm

its ok, not a big fan of the UI, why is the client 70 MB? wtf

gitcommit - April 20, 2026, 9:49 pm

Might I suggest rounded corners?

Hello and thanks for your feedback. The GUI is completely AI-coded.

As you say, the important thing is the stability and proper functioning of the software.

NexusRAT is still under development and ready to share some great news!

As already indicated, NexusRAT is still under development. I created this thread specifically to gather suggestions and criticism.

Thank you.

I'll think about it, thanks.

? GUI Redesign Update – Command Center

I've been reworking the server UI lately, aiming to move away from a basic dev-looking interface and turn it into something that actually feels like a proper command center.

Here's a preview:

? New look & feel

Dark theme with neon blue accents (aligned with the logo)

Cleaner typography (Segoe UI / Inter) Subtle glow and shadow effects for depth

? Layout overhaul

Sidebar navigation is now cleaner and more structured Dashboard provides a quick overview of clients and status

Overall layout is less cluttered and easier to use

? Screen preview

Redesigned to resemble an actual display

Added overlay with client info (OS, IP, status, hardware) Quick actions accessible directly from the preview

? Quick actions panel

Centralized most-used features Buttons with icons + labels

Proper hover and interaction feedback

? Dashboard stats

Added cards for:

Total clients

Online / Offline

CPU / RAM usage Easier to get a quick overview at a glance

? Logs

Improved readability Color-coded events (info / warning / error)

Cleaner structure

? Fixes

Fixed various UI bugs (invisible buttons, overlapping elements, etc.)

Improved consistency across the interface General polish

Still refining a few details, but this is already a big improvement over the previous version.

Feedback is welcome ?

Here's a preview ?

? New look & feel

Full dark theme with neon blue accents (matched to the logo) Cleaner typography (Segoe UI / Inter)

Subtle glow + shadows to add depth without overdoing it

? Layout overhaul

Sidebar navigation is now structured and consistent

Dashboard gives a quick overview of clients and status Everything feels less cluttered and easier to navigate

? Screen preview

Redesigned to look more like an actual display Added overlay with client info (OS, IP, status, hardware)

Quick actions directly accessible from the preview

? Quick actions panel

Centralized most-used actions

Icon + label buttons with proper hover states Much faster to interact with compared to before

? Dashboard stats

Added cards for:

total clients

online / offline

CPU / RAM usage

Makes it easier to get a quick snapshot at a glance

? Logs

Improved readability

Color-coded events (info / warning / error) Cleaner structure overall

? Fixes

Fixed multiple UI bugs (invisible buttons, overlapping elements, etc.) Improved consistency across

views

General polish

Still a few things to refine, but it's already a huge step up from the previous version.

Open to feedback if you've got ideas ?
