Thread: [YOUR PHONE HAS BEEN COOPERATING WITH INVESTIGATORS SINCE DAY ONE](#)

1stShepherd - April 22, 2026, 9:41 pm

Every time you politely ask Google Maps, "How do I get to Sheetz?" your phone doesn't just help you; it takes meticulous notes. It records every "turn left," "slight right," and "continue for 92 meters" like an overachieving court stenographer who nobody hired but nobody can fire.

The suspect's device preserved three complete routes, all originating near Wilbon Road, with step-by-step navigation segments, including:

- a. Exact turn instructions ("Turn right onto NC-55 East")
- b. Distance per segment (down to 13 metres)
- c. Duration per step (some as precise as 9 seconds)
- d. Start/End GPS coordinates
- e. Timestamps accurate to the second

Why Investigators Absolutely Need This

1. Corroborating or Destroying an Alibi: A suspect claims they were home at 11:19 AM? Their phone was actively navigating routes near NC-55. Timestamps don't negotiate.

2. Establishing Pattern of Movement Three saved routes from the same origin point suggest deliberate, repeated travel, not accidental presence at a location.

3. Placing a Suspect at a Scene: GPS coordinates extracted from route data can be cross-referenced with cell tower records, CCTV footage, and witness statements to build a corroborating location chain.

4. Intent and Premeditation Saved/cached routes can demonstrate that a suspect planned to travel somewhere ; not that they stumbled upon it. Route 3's turn toward Judd Parkway and NC-55 West creates a traceable path.

5. The Cache Doesn't Lie Notice the left panel: 159 cached addresses and 113 audio files. The device preserved this data even if the user thought they'd deleted it. Forensic tools recover what users believe is gone.

FUN FACT: Your navigation app is essentially a very loyal, very detailed diary that writes in your name, never sleeps, and hands everything over to forensic investigators without a single complaint. You asked it for directions. It gave you directions and a timestamped legal record of everywhere you went.

You have to turn on Location History, and a forensic lab must successfully perform an extraction.

I just hate inaccurate fearmongering.

Hie ,

Basically, whenever you use maps for directions, your phone keeps a pretty detailed record—routes, turns, time, locations, everything. Even if you delete it, a lot of that data can still be recovered .That's why it becomes strong evidence because it can show where you actually went, when you were there, and even if you planned the trip or not. In simple terms, your phone quietly keeps track of your movements whether you realise it or not. that is why it is said we check our phone for freedom, but end up losing more of it.
