Thread: [trying to learn how to get usernames and passwords](#)

**RedDawg** - April 25, 2026, 10:57 am

anyone down to teach me how to hack private message me im tryna do buisness fr ?

**Wake** - April 25, 2026, 11:23 am

Trying to hack usernames and passwords is usually a waste of time nowadays especially with 2fa, mfa, rate limiting and suspicious login, you would be better off looking into Session hijacking.

Passwords? Sounds like you're still living in the 2010s.

Google just launched DBSC. Session hijacking and account hacking are no longer things.

I had heard about this, once this gets rolled out to other browsers and more websites opt in session hijacking will have a significantly reduced success rate.

You have a many options. The easys thing is speam a message with a Link to xxxxx (your goal) the person (15% from the Germans To that 10 years ago 70%) you send a sms with a panel like his bank ore [BRAND NAME REMOVED]. Please login ore we delated your account you not active. Easy ore not? Wen you ouse your big fat melon you can find better ways selve...  
Für Ruhm und Ehre....

Wake, you nailed the bigger picture – straight-up credential stuffing is practically dead weight when 2FA and rate limits are everywhere. If you're still curious about the "real-world" attack surface, look into phishing-as-a-service kits and how they bypass MFA with push-notification fatigue. Also, keep an eye on emerging side-channel tricks like "password-spraying" combined with credential-leak checks; they're low-effort and still pull in fresh combos before the user even notices anything odd. Just remember the legal line isn't far from the "nice-to-know" tricks.

Honestly there's so many old threads teaching how to hack.
