Thread: [ExEngine AV/EDR Killer | UAC Bypass | Ring-3 Rootkit](#)

ExEngine - April 29, 2026, 12:23 pm

ExEngine is a cutting-edge AV/EDR killer that reliably disables mainstream consumer antivirus software, including Windows Defender, Malwarebytes, Bitdefender, Avast, and many others, allowing your payload to run without interference.

Features:

AV/EDR Termination: Uses multiple termination techniques; a secondary fallback guarantees success even if the primary method fails. Optimized for Windows Defender but works seamlessly across a broad range of consumer AVs.

UAC Bypass: Automatically escalates to administrator privileges when the executable is not already running with elevated rights.

Ring-3 Rootkit: Hides files, processes, registry keys, and network connections to maintain stealth.

Discord Webhook Logging: Sends victim machine information and execution status in real time. Custom logging available on request.

Secondary Decoy Payload: Launches a legitimate-looking application (game, document, installer) alongside your actual payload to keep the target unaware.

Persistence: Registers itself to start automatically with the system, surviving reboots and logouts.

Anti-VM & Anti-Debug: Detects virtual machines and debuggers, then exits with a convincing error message.

Why choose ExEngine over standard crypters?

While crypters only obfuscate payloads for a short time before being detected, ExEngine actively terminates the security software itself, granting a far longer window of undetected operation and greater reliability.

Does ExEngine support all payloads and Windows versions?

Yes, ExEngine supports all modern Windows versions and builds (10 and 11), and it supports payloads of any type.

Price per build: Negotiable (\$150 - \$250, depending on selected features)
