Thread: [Control an army of 1,000,000+ agents using this Redis-Powered botnet from your phone!](#)

TheCowardlyDog - April 29, 2026, 3:10 pm

Cloudflare Worker Mailbox Client (Redis-Powered) is a mobile-friendly command console for managing signed Rust agents through a Redis-backed FastAPI control plane and Cloudflare Worker mailbox transport. It supports live agent status, filtering, grouping, selection sets, signed commands, update pushing, uninstall/remove lifecycle actions, rolling update counters, command results, logs, health checks, HTTPS, SHA-256 verified downloads, and guided next-step prompts after every command — all from a Python CodePad iOS terminal interface.

Hi! I'm TheCowardlyDog.

I've created a botnet which is powered by Redis (which is scalable depending on how powerful your Linux/Windows VPS is).

This botnet is designed to be controlled from your mobile device using Python CodePad for iOS, it has a terminal view of your clients and allows you to send commands.

It used Cloudflare Workers to send and receive messages, and Redis and PostgreSQL for heartbeats and logging.

It really can handle any number of bots, it's extremely stable.

The agent is wrote in Rust, which means Windows 7 - 11 (and future Windows versions) with zero dependencies, I can guarantee a 100% installation rate.

The terminal is wrote in Python and so is Redis.

Commands include list, summary, use, details, logs, find, filter, group, sort, and fields for viewing and organising agents; select filtered, select all, and select clear for batch targeting; send, broadcast, and outbox for mailbox messaging; update, download_update, and updates for signed update delivery and tracking; plus remove, uninstall, ping, health, clear, help, examples, and exit for lifecycle, diagnostics, and general console control.

It looks like this:

Sorry, I couldn't post an image, imgur is down.

If I can get support for this project (people saying "Yeah I'd buy that") I'd be happy to make this project available.

My installer for the Rust agent is in MSIX (code signed binary), if you wanted this as well you'd have to pay for code signing (but it's FUD forever).

This botnet does not support any malicious actions, it lets you see who's online and group by stats, you can also push updates (download a file).

This tool is for legitimate purposes only.
