Thread: [FlatLine DoS Tool with GUI](#)

SIM-5732806 - May 5, 2026, 11:12 am

Need a custom-built Go-based Layer 7 DoS engine ? Here we are !

This isn't your standard public-repo script; it's a stabilized, stealth-focused implementation designed for high-performance load testing and perimeter bypass.

CORE SPECIFICATIONS

Dynamic L7 Mutation: Integrated POST/GET mutation engine. Evades static pattern matching and basic WAF rate-limiting.

JA3/uTLS Spoofing: Perfect browser impersonation (Chrome 120, Firefox 120, Safari 16). Prevents fingerprint-based drops at the TLS handshake level.

ALPN/HTTP2 Enforcement: Native support for h2 and http/1.1 negotiation. Fixes "Malformed Response" errors on Vercel/AWS targets that mandate binary frames.

Intelligent Ramp-Up Control: Granular control over worker spawning. Mimics organic traffic spikes rather than instant TCP bursts to bypass threshold-based IPS.

Rotating Proxy Rotator: Sequential Round-Robin support for massive IP distribution.

ENGINE CAPABILITIES

Raw Request Parser: Import browser-inspected requests instantly. Automatically maps Cookies, JWTs, and headers into the attack vector.

Profile Management: Save/Load full session states (Targets, Headers, Params) in JSON.

Real-Time Telemetry: Live RPS tracking, Error/2xx ratios, and P95 latency monitoring.

Safe-Mode & Jitter: Optional timing noise to break automated detection signatures.
