Thread: [bluetooth hacking](#)

noname031 - May 6, 2026, 3:08 am

hay i want to learn Bluetooth hacking hacking can anyone share his knowledge with me ?

thanks

Burnzy - May 6, 2026, 3:28 am

you can get one of ESP32 pentest devices with marauder firmware. You can get those from Aliexpress

Bluetooth hacking is hardly worth an academic discussion. 5.x/6.0 are considered secure.

Under no circumstances should anyone buy that Aliexpress crap. My Marauder didn't come with a working microSD card reader. I sent it back for a 10% refund.

Bluetooth hacking isn't really something you "learn from a person" like a trick — it's more networking + security basics first. Most stuff you see online is either outdated or straight-up fake.

If you're serious, start with how Bluetooth actually works (pairing, BLE, encryption, etc.), then move into Linux and basic networking. Without that, any "hacking tool" you find won't make sense.

Also important — don't mess with random devices. Stick to your own setup or a lab, otherwise it can get illegal fast.

If you want structured learning, try platforms like TryHackMe or Hack The Box. They actually teach wireless/security step by step instead of shortcuts.

In short: it's not about finding a tool or someone to share "hacks", it's about understanding the system first.

I only got the wifi devboard for aliexpress for my flipper zero but i didnt see a lot of complaints that something doesnt work. I only recommended this as the op seem to be new to this and should get

something cheap first to experiment with. He will probably get bored fast as there is no much you can do with BT. The best my flipper can do with BT is annoy people with BLE spam

Never had an issue with any of my ESP products, sounds like you purchased from an untrusted seller. No free returns label or dispute you could have opened?

A Marauder devboard from China may indeed work acceptably if you never try updating firmware. I got a Mini, I think. Not many details were provided.

I am also trying to get into this.. specially the one where you spam packets to silent music on a speaker.
