Thread: [UnityScraper - AI-Written XboxUnity Asset Scraper](#)

Null State - May 13, 2026, 6:05 pm

Been experimenting with AI-assisted development lately and ended up making this:

<https://github.com/TrapEmAll/UnityScraper>

? loading encrypted image...

XboxUnity is a long-running community platform centered around Xbox 360 modding and preservation. It's mainly known for hosting:

- Title Updates (TUs)
- downloadable game content metadata
- XUID/Gamertag tools
- Unity Link services
- * modding resources for JTAG/RGH consoles

A lot of the Xbox 360 homebrew and modding scene used it to manage game updates, multiplayer compatibility, and archived console content that became difficult to find elsewhere.

It's an asset scraping/extraction framework for automating parts of:

- asset dumping
- bundle scraping
- resource extraction
- update tracking

The interesting part is that basically the entire repo was written with AI, I touched nothing at all other than giving it the original XboxUnity URL and prompting

Still refining things, but I wanted to release it publicly and get opinions from people here, especially anyone into:

- Unity reversing
- game modding
- asset extraction
- automation tooling

Would also be interested in hearing how people feel about AI-written tooling in general.

Do you think projects like this are actually viable?

Have had ChatGPT 5.6 go over the code base in multiple iterations making massive improvements to the look and capabilities of this. Much more than it was for sure, as well as quite a bit of expansion on what it can do with Xbox 360 content, as well as full Linux support.

wonderful project. May I know what is the system configuration you using for building this? Is this local LLM or the mainline ones?
