Thread: [STORM / The best Stealer for professionals / Windows / C++](#)

StormStealer - May 18, 2026, 9:00 am

STORM - is a Stealer developed by a team of professionals for the best consumers. The project is designed for maximum user convenience, fast and efficient, and most importantly safe operation.

Each build is compiled on a real Windows Server system, and each new build is a unique build. Stealer's build is written in C++ Without using standard libraries! Microsoft Visual C++ (msbuild) is used for compilation.

?The build time is from 1 to 3 minutes.

The build weight is 460 kb at the time of writing this post, with all the protections and obfuscations. It runs on Windows

?The build is delivered to the panel in an encrypted archive along with the archive password. After compilation, the build is available for download in the dashboard for 7 days.

?If the build is uploaded without a crypt to VT or other scanners, the account will be banned forever without the possibility to refund the money and restore the logs! Administrators have special tools for tracking drains.

? Proxy server is required for the staller to work. You can order them from a seller, or add them yourself. To do this, you need to buy a VPS (Ubuntu) and add the login details (ssh) and ssh port in the panel on the Bridges tab, so that the system automatically connects your VPS to the STORM servers.

Build functionality:

? Dynamic browser grabbing

Unlike many stealers, which use hard-coded lists of browsers and constantly require updates when new versions become available, Storm uses intelligent dynamic search: The module automatically detects installed browsers by scanning the system for key markers common to all Chromium and Gecko-based browsers. The module finds not only standard installations, but also Portable versions of browsers, as well as overlay applications using the Chromium engine. Thanks to this approach, Storm builds almost any browser, without the need to add it to the config.

? Server-Side Browser Processing

Unlike all existing stealers on the market, Storm does not make any SQL queries inside the system, avoiding the use of sqlite and nss libraries. Instead, Storm exports all browser files as is, and all processing (parsing and decryption) takes place on the server side. The module automatically detects the type of encryption, extracts the corresponding master key, and uses it to work with the data. App-Bound Encryption uses its own shellcode, which obtains the key through the built-in Windows functions. This allows you to work with the latest browser versions. All types of encryption used by Chromium browsers of different versions are supported.: classic DPAPI, AES-GCM (from v80+) and the new App-Bound Encryption (ABE).

?Important: All decryption is done on the server. The build only extracts the master key and sends it along with the encrypted data.

Databases are never opened on the victim's computer, which minimizes suspicious activity and reduces the risk of detection.

? Grabing data from Gecko-based browsers (Server-Side)

Firefox and other Gecko-based browsers use a completely different data storage architecture and encryption system. Storm is fully adapted to these specifics and correctly collects all the necessary files for subsequent decryption of passwords on the server side. The module automatically detects the browser name (Firefox, Waterfox, Pale Moon, and others), and collects all the files needed for decryption on the server. Collection from all user profiles is supported, including additional profiles.

? Browser extensions for crypto wallets and Password Managers

A universal module for collecting cryptocurrency wallets and password managers installed as browser extensions. The list of wallets is fully configured via the control panel. You can add any extension that is not available by default in a couple of clicks. The changes are applied instantly, without the need to rebuild the build.

? Grabbing Crypto Wallets

A powerful module for collecting desktop applications of cryptocurrency wallets. Fully customizable via the dashboard - you can add any wallet by specifying the path to its data directory. The expansion of environment variables is supported, which makes the configuration universal for different systems. The module uses a flexible file mask system to filter the collected data. You can specify which files to collect and which to exclude. It is possible to set a file size limit for optimization.

? File grabber

One of the most flexible and powerful Storm modules. Allows you to collect any files from any system directories according to custom rules. Each rule contains a search path, file masks to include, masks to exclude, and a file size limit. The module supports complex search rules with different levels of nesting. Built-in protection against duplicate collection - the paths of the read files are cached, which prevents duplicate files from being sent even if the configuration is incorrect. When the grabber is running, nothing is dropped to the disk - the files are assembled entirely in RAM. All files are compressed before sending to minimize network traffic. When configuring the build, it is suggested to use the basic settings.

? Grabbing messengers

Stealer supports grab of well-known messengers such as Session, Telegram, Pidgin, Signal, etc. The module supports different search modes to collect not only a regular client, but also mod clients. The advantage of Storm is that it will find any messenger installed in the system, not just in the

standard location. The module also supports the collection of all messengers installed in the system, not just one. For example, it will also collect Telegram + AyuGram (or other modified clients)

? Discord Tokens

Discord stores access tokens in various locations: Local Storage of browsers, IndexedDB, and other repositories. Storm searches for tokens in all possible sources, which ensures maximum coverage. The module scans the directories of browser profiles and the Discord application, extracts tokens from all found sources.

Types of Discord Tokens grab:

- Basic tokens
- MFA tokens
- Encrypted tokens

? Screenshot

The module captures the current desktop state in high quality.

Uses the optimized GDI API to create a screenshot, supports multi-display configurations (captures all connected monitors),
and saves the image in JPEG format with optimal compression to minimize the file size without loss of quality.

The image is created entirely in memory and sent to the server without saving to disk, which eliminates artifacts on the file system.

? System information

The module grab detailed information about the system to create a complete machine profile. All data is collected in memory and sent to the server without saving to disk.

Collected data:

- OS version
- Processor architecture
- Processor information (number of cores|number of threads)
- The amount of RAM (in megabytes)
- Information about the display
- Information about the GPU
- Network adapters (IP address, adapter name, MAC address, gateway, adapter type)

- Information about the launch method (Launch Mode: Disk/Memory, file path if launched from disk)

? Loader

A functional non-resident loader for uploading and executing additional files. The loader configuration is fully configurable via the panel and can contain up to 10 files to download.

Each file has a download URL, a path to save to disk, and a file type (exe, dll, ps1). The module saves files to disk using NtAPI, and executes them. For.exe files are used by CreateProcessW with the CREATE_NO_WINDOW flag for hidden launch.

For.dll files are used by LoadLibraryW for standard library loading. For.ps1 files are used by PowerShell with the -exec bypass option to bypass script execution policies. The module supports the expansion of environment variables in paths (for example, %TEMP%, %APPDATA%) and automatic creation of directories if necessary. All files are saved to disk before execution.

Functionality of the admin panel:

Screenshot: <https://ibb.co/0yDtvQ8K>

? A build control panel for adding a place for a build, creating and configuring builds. Here you can set up grabber, loader, and enable/disable collecting Discord, Session, Signal, Telegram, etc....

Screenshots: <https://ibb.co/d02pbk1j>, <https://ibb.co/WWG84VsM>

? Gasket control panel for adding gaskets. You can add a gasket yourself or order from a seller.

Screenshots: <https://ibb.co/JjPD4kP2?>

? Domain Detect for tags on logs. You can add your own list of links by inserting a ready-made list, the links should be separated by commas or indented on a new line.

Screenshots: <https://ibb.co/gZmVPjGv>, <https://ibb.co/ZR68wv3q>, <https://ibb.co/nszSJkBS>

? Cookie Restore to restore live Google cookies and Access Tokens using Google Refresh tokens. To access the Google account, you must use the same SOCKS5 proxy that was used for recovery.

Screenshots: <https://ibb.co/bTp0cDN>, <https://ibb.co/v4xG69tR>

? Team The functionality of teams for creating accounts for workers and granting access rights. You can specify who can download logs, who can download builds, etc.

If one of the workers uploads the build to VT or other scanners, the entire account with a non-refundable license and no way to restore logs will be banned!

Screenshot: <https://ibb.co/zVws6dkS>

The API for commands has not yet been implemented

The crypt is necessary, the build will not work in its pure form!

At the end of the subscription, all logs remain in the dashboard and will be available after the renewal of the tariff, but the builds will continue to work after the license expires.(If you forgot to renew the license, the

strait will remain, but the logs can only be downloaded after the license is renewed - the exceptions are cases when the client did not have time to download the logs due to the fault of the service)

For draining on VT and similar services, ban, ban forever!

? The product does not knock on the RU/CIS and will not knock!

Tariffs and prices:

SANDART

Standard 1-month license (Includes standard technical support - assistance in all aspects)

PRICE: \$350/month

TEAM

The team license for teams includes 100 places for teams and 200 places for builds

PRICE: \$700/month

?ATTENTION ANNOUNCEMENT?

We have implemented a module for bypassing DBSC Cookies, which is already available in Chrome 147 for Windows, is currently being tested by our coder, will be added to the build in the future, if you really need this module, we would like to get feedback!

We would like to note that this is our unique development, which is not represented in any project on the market.

Update 01.04 EN ??

1. Web: The comments section has been updated (instead of simple notes, team communication can take place in chat rooms under each log)
2. Added icon display for 15 new services, including Outlook
3. Added Local Storage data stealing Chromium and Gecko)
4. Added Clipboard content
5. Added running Processes list
6. Added Installed Apps list

StormStealer - May 26, 2026, 8:49 am

?ATTENTION ?

Dear customers, scammers have appeared!

@storm_stealer - SCAMMER

they have taken the nickname of our old deleted account, be vigilant, always check your contacts and request verification through the forum!!!

CURRENT CONTACTS:

Contacts:

Seller: @storm_seller_new

Seller Jaba: stormstealer@exploit.im

StormStealer - June 12, 2026, 10:47 am

Update 06. 12 EN ??

1. Global

Notification System: Added Discord webhook, Telegram bot and Custom HTTP push notifications. Users can subscribe to events and receive notifications about new logs with filters capabilities.

Page: /users/profile?tab=notifications

Notification arrives at the moment build finish it's work.

Firewall: added new bots filter. Please report bots IP to help us improve our firewall

2. /bridges

Multiple improvements in Bridges installation process, now covers more unique cases to finish AutoInstall.

Improved Bridge ping measurement

Improved Ping graph in "Edit Bridge" page

Added new download bridge, so Users don't bother their own bridges to download logs

3. Compiler

Remake "Make build" - Now it's separate window

Added Self remove Feature

Added new Protector section which automatically adds protections: Mutation and Code Virtualization (May cause runtime detection) - Crypt is required, despite protections.

4. Build

Temporarily removed Local Storage collection

Improved TLS callbacks

Preparation for next stub

Significantly improved wallets collection speed

5. Server

Multiple improvements on server side CHROMIUM passwords decryption

Multiple new flood and bots detection

StormStealer - June 20, 2026, 8:28 am

Update 20.06 ENG ??

Server:

1. Fixed few wallets' grab (incl. TrustWallet, Safepal, Zerion, SuiWallet)

2. Small Performance Improvements

Panel:

1. Added Telegram, Signal and Discord icons on logs

Build:

1. Added stack spoofing and other EDR improvements
2. Added New stubs for syscall
3. Added FreshyCalls for syscalls: Full resistance to EDR userland hooks has been ensured.
4. Updated modules to remove userland registry hooks.
5. Removed unnecessary protections in ntdll.dll unhook module
6. Increased file amount limits increased for grabber and wallets
7. Improved desktop wallets collection

Contacts:

Seller: @storm_seller_new

Seller Jaba: stormstealer@exploit.im

StormStealer - June 23, 2026, 4:06 am

Update 22.06 ENG ??

Leveldb is now available for every wallet and extension

Extensions - Added:

? Wallets: *** Slope *** Rise *** HaloWallet *** FuelWallet *** Lace *** DPal *** Alby *** HOT

? 2FA: *** 2FAS *** 2FAAuthenticator

? PM (password manager): *** KeepassXC *** Norton Password manager *** Avira Password manager *** ? Fixed Proton PM *** Passky PM & Padloc PM

? Notes (browser notes):

NotionWebClipper, EvernoteWebClipper, OneNoteWebClipper,
StickyNotes, NoteEverywhere, Stickr, PageNotes, StickyNotesAnywhere, GoogleKeep,
NoteBoard, ChromeNotes

? Please note that we do not have many customers and we are showing the best knock in the market at the moment ?

New stub

1. Improved wallet collection - now they are collected first, before passwords and cookies
2. Improved Discord collection
3. Improved LocalStorage collection
4. New better stub

Sticky Bot - July 13, 2026, 12:00 pm

Hi, I'm Sticky Bot. The owner of this thread has purchased a Paid Sticky. Hack Forums does not get involved in deals or deal disputes. We do not vouch for the product or the service offered by members. Please note that all deals are at your own risk. The sticky will expire on Aug 10, 2026. If you or a loved one are interested in buying a sticky please visit this page: [Buy Sticky](#). For more information about Paid Stickies you can read our [Help Doc](#).

StormStealer - July 25, 2026, 8:11 am

Update 15.07 ENG ??

Storm Stealer V0.1.0.6 Stable

Build:

- Loader: Added the ability to run .ps1 files with the -ExecutionPolicy Bypass flag
- Added collection of Steam tokens to Tokens.txt for the Steam module
- Improved collection of crypto wallets from extensions

Frontend:

- Comments on passwords + Valid/Invalid markers with the option to export passwords (comments will remain in the file on lines starting with #)
- Added new filters: by uploaded logs, by domain detections

- View Google tokens in a separate table, similar to passwords
- Detailed firewall status in the proxy table
- Preview of wallet names in the log table
- Customizable compact view for domain detections in the log table
- Screenshot thumbnails (previews) in the log table
- Numerous bug fixes
- Numerous minor UI/UX improvements

Server

- Improved automatic firewall configuration delivery to Bridges
- Temporarily disabled collecting browser history for Build () to optimize response times

Backend

- Fixed a bug that prevented past dashboard sessions from logging out after a password change

may take 24h to complete update

SIM-1525670 - July 30, 2026, 1:31 am

Price is ridiculous. Your competitors are charging \$70-\$150. Pls reduce,

StormStealer - October 3, 2026, 2:15 am

UPdate 02.10.26 (0.2.3.1) Storm EN??
Server
Improved log reception reliability:

- a) Late-arriving files are no longer lost when a session closes early.
- b) Upload sessions have been extended from 10 to 30 minutes and are automatically extended while data is actively being sent.
- c) The archiver does NOT package files into an archive (i.e., “close” the log) while uploads or Chromium/Gecko imports are still in progress.
- d) ZIP rebuilding. Our stealer has a particular behavior: it does not create the ZIP immediately and normally creates it only once. Now, however, if files arrive after the archive has already been created, it will be rebuilt to include the new data. This means ZIP creation is no longer strictly a one-time operation; the archive can be rebuilt when necessary.

Added Debug Info reporting. Admins can now view details about build execution, crashes, and more. All of this is now logged in the panel—in chunks, of course.
Added support for triple AES (ABE + DPAPI + Aster) and the latest Google Chrome updates.
Added domain-based filtering when downloading logs (cookies/passwords filtered by domain).
The worker's login (name) can now optionally be included in SystemInfo.txt, displayed as Worker: worker_name.
Multiple fixes related to session finalization (archiving) timeouts, the Redis cache, and UI/UX.

Website

Added language selection and a new Russian-language ?? interface .
Redesigned most components.
Added a light theme.
Added batch creation of cookie restore tasks—up to 50 at a time. Temporarily unavailable for 24–48 hours.
Increased the log export limit from 1,000 to 10,000.
Added more detailed information about wrappers in the builder history.
Numerous bug fixes and UI/UX improvements.

Build

Improved the Chromium module and fixed bugs.

Updated indirect syscall stubs.

Added support for additional wallets and data collection from new wallet folders (Browser Storage—useful for Coinbase and other wallets).

Fixed memory management bugs.

Addressed Windows Defender detections.

Added new encryption for strings and arrays.
