Thread: [V-Entity Trojan Remote Collection & Trojan Control](#)

storyt3ll3r - May 21, 2026, 8:41 pm

Been building this for a while. Time to share.

Violet Entity is a remote collection platform for Windows targets. The agent is compiled per-user with custom settings, icon, and paths — every deployment is unique. Low detection footprint against Defender and common AV.

Capabilities:

- Remote screenshots with gallery (zoom, batch select/delete)
- Keystroke logging with reconstructed readable text
- Crypto wallet detection — 100+ wallets, seed phrases, private keys
- Secret tracing — cards, bank accounts, PayPal, API keys, SSH, 2FA codes
- Password extraction — Chrome/Edge/Brave with one-click copy
- Directory reconstruction from raw logs
- Remote command execution — write commands, read results
- Email & domain extraction from credential data
- File browser with direct download
- Trojan Builder — compile your agent with preset path groups (browsers, wallets, messaging, auth, databases, cloud, email, password managers), binder/host EXE stubbing, compiler options (LLVM/Clang, MinGW, UPX)
- Per-system capture interval control
- Multi-system dashboard with real-time status

Every user gets a private dashboard with isolated cloud storage and agent config. Build, download, deploy — all from one place.

Pricing:

3-Day Trial	\$7
7-Day Trial	\$13
Monthly	\$29
3 Months	\$69
6 Months	\$119
Lifetime	\$279

Hello

Can we get a picture of the interface?
