Thread: [Over 320 NPM Packages Hit by Fresh Mini Shai-Hulud Supply Chain Attack](#)

MadScientist - May 27, 2026, 10:36 am

A fresh Mini Shai-Hulud supply chain attack has hit over 320 NPM packages, along with GitHub Actions and a VS Code extension, security researchers report.

The NPM maintainer account 'atool', which has access to multiple packages across the @antv namespace, and which publishes timeago.js (1.5 million weekly downloads), was compromised and used to publish malicious package versions.

The attack propagated downstream to other highly popular packages, including echarts-for-react (~1.1 million weekly downloads), "impacting a much broader set of applications and continuous integration (CI) environments," Microsoft warned on Tuesday.

According to Socket, roughly 639 malicious versions of the compromised packages were published across "data visualization, graphing, mapping, charting, and React component ecosystems".

"Across the full Mini Shai-Hulud campaign we have tracked 1,055 versions across 502 unique packages. The campaign spans NPM, PyPI, and Composer, with NPM representing the overwhelming majority of the activity: 1,048 NPM versions across 498 unique NPM packages, plus 6 PyPI entries across 3 packages and 1 Composer package-version entry," Socket notes.
