Thread: [EXPLOIT FOR Drupal CVE-2026-9082 - SQLi](#)

SIM-5732806 - June 2, 2026, 12:33 am

Hi guys,

Just finished CVE-2026-9082 exploit for the last Drupal vulnerability (HIGHLY CRITICAL). Working 100% on vulnerable targets.

"A vulnerability in this API allows to send specially crafted requests, resulting in arbitrary SQL injection for sites using PostgreSQL databases. This can lead to information disclosure, and in some cases privilege escalation, remote code execution, or other attacks."

Here is exploitation proof <https://www.pasteboard.co/guvsGPwHLOrT.png>

If you are interested for getting the exploit feel free to contact me.

You selling this or what? I already found many public free POCs , all for free.

What's the difference between yours and free ones. All around the internet. Google easy.

The only public one is on 7h30th3r0n3 github, this tool relies on a basic pg_sleep-based timing oracle and manual single-target execution.

Mine implements a multi-mode boolean oracle (division-by-zero, modulo, integer overflow) with nine static and four dynamic parenthesis-balance variants, enabling reliable extraction in under 100ms per bit — more than 100x faster than a timing-based approach.

Also integrates full intelligence-gathering pipelines (Shodan, FOFA, Censys), asynchronous batch scanning across thousands of targets, automatic flood evasion through IP spoofing and endpoint rotation, and an exec-time JSON:API oracle that bypasses Drupal's anonymous access-control filter — none of which exist in the public PoC.

In short, my tool is a production-grade assessment framework built for real engagements, while the public PoC is a demonstrative script suited only for controlled single-target testing.

I sent you a PM.
