Thread: [Recruiting the Best Website Penetration Testers](#)

Adoring Fan - June 4, 2026, 6:52 am

I am looking to hire skilled website penetration testers for authorized security testing on websites that I own and control.

1. Experienced website penetration testers who can assess a site from initial reconnaissance through validated proof of concept findings
2. Strong knowledge of web application security, authentication flaws, business logic issues, API testing, access control, payment flow weaknesses, file upload issues, SSRF, SQL injection, XSS, IDOR, RCE, and common CMS vulnerabilities
3. Ability to work professionally within a defined scope and rules of engagement
4. Clear reporting with severity ratings, reproduction steps, evidence, risk explanation, and remediation guidance
5. Testers who can communicate clearly and do not disappear mid engagement

Examples of payable findings may include:

Critical severity: confirmed remote code execution, authentication bypass, unauthorized admin access, serious payment logic flaws, exposed sensitive customer data, or full account takeover.

High severity: IDOR with sensitive data exposure, privilege escalation, file upload leading to server side execution, SQL injection with confirmed impact, or access to restricted internal functions.

Medium severity: stored XSS, serious business logic flaws, sensitive information disclosure, weak access controls, or vulnerable API behavior with limited impact.

To apply, send me a PM with your contact information and I will reach out shortly. This is repeat, high paying work. [warn]
