Thread: [BTC price hasn't moved in 5 years](#)

Bayes - June 4, 2026, 11:55 pm

ATH in 2021: \$67k

ATH in 2025: \$115k

Today: \$62k

If you held BTC for the past 5 years, you lost money. Those who just bought US tech stocks (Micron, AMD, Nvidia) likely 5x-20x'd their investment.

Although BTC looks bearish, I still think it's a long term hold. Every major crash like this has been followed by new ATHs. And the high volatility in BTC means there's potential for big upside. I predict it could breakout to \$250k in 2028.

Noble - June 5, 2026, 1:05 am

If BTC hasn't moved in 5 years, it would have floated around the same price. Wouldn't be any up-or-down movement at all.

Dipu4u - June 5, 2026, 4:21 am

True investing in some good companies there is always tenfolds of returns. very good results on return

I just searched what is the price of btc in 2021 you are truly right.

We come at that place where we have been started from.

Cryptocurrency to me still at the moment is unpredictable for me. I will predict it will go more down. and i am on bearish side. the end is no where it can reach further how much down. there is no bottom and no top

Think it this way, you bought 5 years ago and sold at 120k, now you got the chance to obtain about 2x the BTC for the same amount.

Omniscient - June 5, 2026, 5:49 am

This same thing happens in stock market investing when markets are down. You buy index funds at peaks then market spends a year in downturn. Those who sell at those lows are always the losers. Those who hold on are always the winners. Those who buy in on the lows are the masters.
