You can also do remote password dumping of Windows user accounts. ?

YouTube Video: [watch?v=u0MQljHrpNg&t=22s](https://www.youtube.com/watch?v=u0MQljHrpNg&t=22s)

Is this a tutorial? It's not like you're sharing a hacking tool. And a pretty worthless one at that. Dumping LSASS no longer works. Can provide proof.

I did it on the video proof! ? Keep in mind that Mimikatz will not work in Powershell.

I watched over 9 minutes of your proof. It was all messing around without even running mimikatz, just showing off your fancy ncat wrapper. Didn't watch enough to see how you run mimikatz in a noninteractive shell, but I did see the Microsoft 10.0.19045 banner. Nice try hacking an EOL OS. And based on your cheatsheet, you dump cleartext passwords from wdigest, which hasn't been possible in years. Maybe you quickly crack the hash, but this seems like misinformation.

Oh, and Invoke-Mimikatz is a PowerShell script that used to work.

Thanks for letting me know!
