I am coding a lightweight rat. I have a couple of features currently:

Encrypted C2 channel using AES 256

Remote Shell

File Transfer

Keylogging Toggle

Screenshot

Startup using reg keys

I know most of the known features of other rats, give me some out of the box ideas.

Plans:

Reflective DLL loading

Dynamic C2: need ideas other than github.com and pastebin ?

AES 256 is pretty good encryption still today, haven't heard of any MD5 hashes being cracked, the odds of me guessing the entire numeration of that free daily crypto manual wallet are slim to none. For the RAT to work well on Windows 11 you'll have to mask it pretty good, I hear today people use Pdf and docx files, before you could not do that it was always an executable attached to maybe a dependency found in the windows folder before 64bit operating systems. You cannot touch the windows registry, it will null out the os. I never really got into cryptography, it was always so stupid to pay for a token when the seller would just bind the file to a dll.
