Thread: [Browser wallet extension grabber + seeds phrase extractor | Admin panel | Source code](#)

Strike- - July 12, 2026, 8:58 am

The Target machine opens an .exe file (no administrator access needed). The program checks 6 supported browsers for crypto wallet extensions. If it finds one, it removes it and installs a fake copy.

Once the target enter his password to the fake extension, the server will be able to decrypt the wallet and extract the seeds phrase to the admin panel.

Features:

Fully undetectable by windows defender.

Many supported extensions (i can add more if requested)

Support many browsers

Coded in c++

Price: 499\$ source code

Middleman/escrow is accepted

Send me a pm here or telegram [@strike_shop](#) if you have any questions

Interesting software.

So it installs a new extension into the browser? Chromium does integrity checks precisely to fix that kind of malware in extensions. Is your program bypassing that?

Im curious.

Hello, my software bypass everything and make sure that the real extension is removed and replaced with our fake extensions.

you can grab a test if you're interested.

thanks
