Thread: [Multi-Chain Crypto Drainer Source Code | ETH/TRON/BNB | Minimal Warns | 530+ Wallets](#)

hiskill - July 12, 2026, 11:53 am

? DrainCheck — Premium Multi-Chain Drainer Source Code ?

The Most Realistic Coinbase-Style Drainer on the Market

Free Demo Available — You can personally visit the phishing pages, test the drainer in real time, get demo access to the Telegram Bot and even try the Admin Panel before buying.

Looking for a powerful, clean and easy-to-use drainer with excellent conversion?

DrainCheck is a complete monorepo solution that combines highly realistic phishing pages with strong backend logic and a convenient Telegram control panel.

Why DrainCheck Stands Out

99% Coinbase-Like Design — Extremely realistic check pages that build instant trust. Two versions: Ethereum and TRON. More ready-made landing pages will be added in future updates.

Mobile-First — Perfectly optimized mobile versions for Trust Wallet, MetaMask Mobile, and others.

530+ Wallets Supported — Works with almost every popular wallet.

300+ Networks — Universal contracts that work across the entire EVM ecosystem. New EVM networks can be added very easily.

Permit2 on Ethereum & BNB — Drains up to 30 most popular ERC-20 tokens (by default) with zero gas for the victim. The number of tokens can be easily changed in the config file.

Direct Transfer Mode — Available on all supported networks including Ethereum, BNB and TRON.

TRON — Stable and safe USDT approve method (I deliberately avoided Permit2 on TRON because it is still very raw and causes only extra problems, such as poor compatibility with many wallets and unnecessary pop-ups).

Telegram Bot + Admin Panel

Full-featured private Telegram bot with beautiful interface.

Russian and English language support.

Create unlimited checks with one click.

Add and remove admins — easily build your own team of workers.

Choose drain mode (Permit2, Approve, or Direct Transfer).

Real-time statistics and flexible notifications.

Monitor and manage all activity in one place.

Technical Advantages

Modular Architecture — Minimal dependencies between layers. You can easily add new phishing landing pages, drain modes, and new EVM networks with minimal changes.

Excellent Logging — Detailed event logging for quick debugging if needed.

Clean & Maintainable Code — Well-structured and easy to modify.

What You Receive

Full source code (Frontend + Backend + Bot + Smart Contracts)

Detailed deployment instructions + I will personally help you with deployment

Docker Compose setup

30+ languages support

Free Demo — Full access to phishing pages, Telegram Bot and Admin Panel so you can test everything in real conditions before purchase

Full support and future updates from the seller

Post-purchase customization available for an additional fee (I can rewrite or add any features you need)

Work through Escrow only — your safety is guaranteed

? Honest Note from the Developer

While many sellers promise "magical 0-day bypasses with zero warnings on all wallets" — they are boldly lying.

No bypass in the world can remove warnings 100%.

Heavy code obfuscation often increases red/yellow warnings in modern wallets.

My drainer shows minimal or no bright warnings on roughly 70% of wallets thanks to careful optimization, not magic.

Price: \$480 — one-time payment for full source code.
No monthly fees. No hidden commissions. Full ownership.

If you're tired of overpriced kits with empty promises — welcome to DrainCheck.

Ready for a free demo?
DM me and I'll show you everything in action.
