Thread: [Chat GPT triple murder investigators probing the sensational triple murder](#)

The Pact - July 24, 2026, 10:44 am

Oh, wow. What an absolute pair of visionary criminal masterminds.

Meet Kenneth, a 25-year-old "engineer" who clearly used up all his brain cells getting his degree, leaving absolutely none for basic human morality. For six whole months, this tech genius treated a popular AI chatbot like his personal concierge for slaughter. You can just picture him typing away: "Hey chat, what's the most efficient way to slaughter my girlfriend's entire family, get rid of the evidence, and scrub out bloodstains? Asking for a friend." Because nothing says "independent thinker" quite like needing an algorithm to map out your multi-victim murder plot.

And let's not forget his lovely live-in accomplice, Shwetha, who traded a high-paying corporate career for the ultimate transactional relationship. Apparently, her investment strategy involved funding Kenneth's social isolation and helping him execute her own mother, father, and 20-year-old sister. Terrific teamwork.

But the absolute peak of Kenneth's deranged brilliance? The furnace. He originally built an iron furnace to start a "cloud kitchen" because who doesn't love a side of tech-bro entrepreneurship with their homicide? When the urge to murder struck, he actually asked the AI for a literal Yelp review on the "merits and demerits" of incinerating human bodies. You can't make this up. The AI apparently gave him the pros and cons, and Kenneth thought, "Perfect, let's repurpose the cloud kitchen equipment!"

Their bulletproof plan fell apart on June 22 because, shockingly, they aren't as smart as the software they copy-pasted their ideas from. After Kenneth stabbed Shwetha's mother 26 times and ambushed the father and sister, the couple thought they were home free. They casually strolled over to the parents' house, snatched some cash and silver ornaments, and fled to Puducherry for a nice little post-murder vacation.

Too bad for them, Shwetha's father was a hero. Despite sustaining fatal injuries, he managed to crawl out onto the staircase and use his final breaths to name his own daughter and her AI-whisperer boyfriend to the neighbours.

Now, the tech-bro and his enabling partner are sitting in jail. And the best part? Shwetha is already singing like a canary to the cops, practically begging to confess in exchange for a pardon. So much for that deep, transactional bond. Meanwhile, the police are reading through Kenneth's chat logs, meaning his precious AI chatbot is about to become the star witness that sends him away for life. Brilliant execution all around.

B

Accused used AI chatbot to plan killings.
It is people like him that are gonna fuck up AI for everybody. Hope he rots in pieces and requiescat in pace to the victims.

Apparently a cloud kitchen—also known as a ghost kitchen, dark kitchen, or virtual kitchen—is a commercial food production facility that prepares food exclusively for delivery or takeaway. I've never heard of it before.

Wow, low-IQ. And these are the H1B's replacing American workers. They aren't even smart enough to figure out how to murder someone without using AI. Not even smart enough to realize AI usage is evidence against them.

Not sure what the moral of the story is other than Low-IQ animals are dangerous to society.

There's a long history of people exposing themselves in Google searches before their murders. Law enforcement routinely recovers deleted browser data showing suspects researching alibis, poison dosages, decomposition rates, and local police response times prior to committing violent crimes. The media are calling this the first ChatGPT murder. Lol the stupidity.

As for the H1B's replacing American workers, all the first world countries bring in tons of third world people knowing that they'll accept bottom dollar and the worst working conditions and keep wages and salaries down and competition for jobs fierce and miserable in the first world. This is loved by elites, big corporations, and governments. I suspect a lot of countries jumped on cutting AID to the third world after Elon led the way because they think AI can take over a lot and so they don't care so much about keeping the third world healthy for cheap labour anymore? Didn't read that one anywhere just a thought.
