YouTube Channel & Video Intelligence Tool | Bulk Transcript Scraper, Keyword Timestamp Finder & Subtitle Editor

What's up HackForums,

Today I am showcasing/releasing a powerful Python-based automation tool I've developed for deep YouTube content analysis, transcript searching, and subtitle manipulation.

If you are a YouTube content creator, researcher, or digital marketer looking to scan massive channels (even those with 3,000+ videos) to find the exact second a specific keyword was spoken, this tool handles it efficiently. It also features built-in proxy rotation to keep requests completely safe from rate limits and bans.

? Key Features

Full Channel & Video Scanning: Input any YouTube channel URL or a single video ID. The script processes large-scale channels seamlessly, even those containing thousands of videos.

Precise Keyword Timestamp Search: Search for any keyword or phrase across an entire channel's history. The tool outputs the exact videos and the exact timestamps where the word was spoken.

Subtitle & Language Editor: Modify, update, or translate subtitles and target languages for individual videos effortlessly.

Built-in Proxy Rotation: Integrated proxy support to bypass YouTube's strict rate-limiting and prevent IP blocks during heavy scraping sessions.

Python Powered: Clean, modular, and easy to run/modify.

? Monetization Potential

This tool isn't just for personal use—it offers real monetization potential. You can use it to launch your own content analysis service, find high-retention clip opportunities for Shorts/Reels, or offer channel auditing and keyword-hunting services to other creators and agencies.

? Free Live Demo

Don't just take my word for it—I am offering a live demo on YouTube. If you are genuinely interested, drop me a message and I will personally run a scan on your own channel to show you how fast and accurate it is in real-time.

? Get Access & Contact Availability: I do not use GitHub for this project.

Serious Inquiries Only: If you are a serious buyer or interested in getting the full source code and monetization rights, send me a Private Message (PM) here on HackForums to discuss details.

Feedback and questions are welcome below!
