Thread: [\[SERVICE\] Professional Custom Parental Control & Monitoring Solutions \(Android & Web\)](#)

greekdev - August 1, 2026, 2:32 am

Hello HackForums community,

I am offering custom development services for professional-grade Parental Control and Device Monitoring solutions, focusing on Android applications and robust web control panels.

If you are looking to build a secure, reliable system to manage screen time, monitor device activity, or enforce safety policies, I can build it from the ground up or tailor a modular architecture to your exact specifications.

? Core Capabilities & Tech Stack

Android Development: Native and cross-platform Android apps with robust background services and foreground daemons, engineered to stay active and handle strict OS battery management / doze mode restrictions.

Web Dashboard & API: Secure, real-time control panels (Node.js/Laravel) to view logs, manage device policies, and push remote commands instantly. **Core Features:**

- Real-time activity logging and reporting.
- App usage tracking and content/website filtering.
- Remote command execution and policy updates.
- Location tracking and geofencing.

? Security & Architecture

End-to-end encrypted communication between the client devices, server, and the admin dashboard. Clean, modular, and scalable codebase designed for production use.

? Why Work With Me?

Clean Code & Documentation: Fully structured source code, clean architecture, and clear setup/deployment instructions provided upon hand-off.

*** Professional Delivery:** No unstable scripts or rushed spaghetti code—just reliable, production-ready software.

If you have a custom project, a specific feature requirement, or need a full MVP built, feel free to PM me here on forums or reach out via [Your Contact / Discord]. Let's discuss your requirements.
