Thread: [\[Partnership Offer\] Stream View API Integration \(300600 Active Bots Required\)](#)

Serciooo - August 17, 2026, 10:22 am

Greetings,

I am looking for a partner or provider who currently operates a RAT/botnet setup with a consistent active online fleet of 300 to 600 PCs. The objective is to route background viewer traffic to live streaming platforms such as Kick and Twitch.

How the System Works

API Tasking: Once a streamer's username is set via an API request, all currently online PCs will launch a stealth/hidden background browser and join the live stream.

Auto-Sync for New Connections: Any PC that comes online after a task has started will automatically fetch the active task and join the stream.

Clean Execution: When a task is canceled or a bot drops offline, background tasks close cleanly to prevent memory leaks or system bugs. Reconnected PCs automatically resume active tasks.

On-Demand Control: Ability to stop or clear active view tasks instantly via an API trigger.

System Options: I already have a fully working, tested system in place, but I am looking to scale up my capacity. You can either build your own custom implementation using my API or directly run my pre-configured system/loader—whichever you prefer.

Terms & Compensation

Weekly Pay: \$250 / week paid reliably as long as the system remains operational.

Requirement: Maintaining a 24-hour average of 300 to 600 online PCs.

Protection: If payment is ever missed, you are free to revoke API requests or stop running the task immediately—no hard feelings.

If you have the required online PC count and are interested in a long-term weekly arrangement, feel free to reach out.
