Thread: [Question: What is the best ai for unrestricted coding?](#)

Contort - August 22, 2026, 11:32 pm

Im looking for an ai agent like cursor/claude-code/codex that can code rats, stealers or crypters. does anyone have a good recommendation?

Omegai, Venice.ai, any uncensored or abilitated model. Don't expect any AI to be good at bypassing security, however.

tbh the current open weights model that you will find are not that good at reverse engineering work, and are really expensive to run hourly + slow token per second.

i've tried a few and it would end up being 35\$/hour or more for like 30-40 token per second lol....

fast ones that would run for cheaper and higher token per second would be extra stupid even on ethical agentic coding work ...

i think youre better off learning how to prompt to create a legitimate product version of the unethical thing you are doing. not sure if i explained properly.

DeepHat works really well for me. The trick is how you word everything to it
