Have a new tool in development.

A lightning-fast, transparent, and bloat-free C# Windows Forms utility designed for real-time system health monitoring, junk file detection, and automated maintenance.

It is 100% open sourced software. 100% legit standalone precompile. I will make a "premium" version but as if rn, its better than ccleaner by 100 miles...

im not sure if i can post the link to my project so dm me.

I wouldn't mind taking a look at this. I too have made something along the same lines as CCleaner because I despise CCleaner and I think it causes more harm than good.
