Thread: [Anvilpoint CyberOps | Hacker for Hire | Offensive Security | Your Red Team Solution](#)

Anvilpoint - September 27, 2026, 9:35 pm

Are you looking for a professional team to identify and exploit security weaknesses in websites, web applications, APIs, networks, cloud environments and more?

Once you bring the targets, our experts will get to work and thoroughly test these systems for any potential vulnerabilities and security weaknesses.

Exposed services, broken access controls, sloppy API authentication, misconfigured cloud buckets, forgotten subdomains nobody's patched for a month... we find the crack in the wall. And we walk through it.

Who's behind this: Our operators don't come from nowhere. They come from years in cybersecurity. Real penetration testing work, real engagements, real targets. We've earned our place in bug bounty programs across the major platforms. We've reported the vulnerabilities that got patched, and kept the ones that didn't.

Phase 1: Extended Recon (\$50, introductory offer, crypto only)

You pay. You wait a couple of days. We return with a complete report of every possible vulnerability on the target. This is not a lazy scan-and-leave. This is extended, active reconnaissance. Every inch of the target probed. Every vulnerability class is tested against every open port, every forgotten subdomain, every exposed endpoint, every misconfiguration that catches our eye. If it exists on the target, it ends up in the report.

Phase 2: Exploitation (\$50, introductory offer, crypto only)

You like what you see? You pay again. Now we go back and dig into every one of those findings. We investigate deeper, we chain the small holes into big ones, and we actively try to exploit what we found. Phase 1 tells you where the cracks are. Phase 2 is where we walk through them. Proof in hand, not on paper.

Two payments. Two levels of certainty. Recon shows you the wall's weak points. Exploitation proves they're real.

We turn hidden weaknesses into actionable results.

Fair warning: Not every target is hackable. Some are genuinely solid, some have little attack surface to begin with. But if there's a way in, we'll find it.

We also offer cryptocurrency and OSINT investigations, among other services. Just ask and we'll see what we can do for you!

Hello. Anyone tried this yet and can vouch?

Kakashiknight - October 3, 2026, 8:02 am

If anyone can vouch contact me because it's too cheap to believe.

I'm looking for a hacker asap I have a job that will pay us \$800k usd im not paying this is a partnership after first job I have a second job that will pay us \$4mil and I have a ton of other jobs if I can find a hacker who can hack emails and servers and websites and phones.

Contact me on here if you are a serious hacker
