SIRR LABS

Development • AI • Cybersecurity

Custom technical services for individuals, businesses and organizations.

SOFTWARE DEVELOPMENT

We develop custom software from scratch and also work with existing codebases.

Services include:

- Full-stack web applications
- Backend systems and APIs
- SaaS platforms
- Admin panels and dashboards
- Internal business systems
- Database architecture
- Automation tools
- Data processing systems
- Existing project development
- Bug fixing and debugging
- Refactoring
- Performance improvements
- Production preparation

We can work with a new idea, existing source code, a private GitHub repository or an unfinished project.

AI & AUTOMATION

Custom AI-assisted systems and automation workflows can be developed for specific business or technical requirements.

Examples:

- AI integration into existing applications
- Automated data analysis
- Document processing

- Information extraction
- Classification systems
- Translation workflows
- Research automation
- Monitoring systems
- Alerting systems
- Large-scale data pipelines
- Internal AI tools
- Automated reporting systems

INTELLIGENCE & MONITORING SYSTEMS

We also develop custom platforms for information collection, monitoring and analysis.

This can include:

- Media monitoring
- News aggregation
- OSINT-related platforms
- Multilingual monitoring
- Entity extraction
- Event classification
- Priority scoring
- Risk scoring
- Automated alerts
- Searchable databases
- Analytical dashboards
- Custom reporting systems

Systems can be built around public sources, APIs, internal datasets or client-provided information.

CYBERSECURITY

Authorized and defensive work only.

Available services:

- Source code security review
- Web application security review
- API security review
- Authentication review
- Authorization review
- Vulnerability analysis
- Dependency review
- Security hardening
- Patch validation
- Malware and suspicious file analysis
- Incident analysis
- Log analysis

- Security configuration review

Reviews may cover:

- SQL Injection
- XSS
- CSRF
- SSRF
- IDOR
- Authentication weaknesses
- Authorization weaknesses
- Exposed secrets
- Unsafe file handling
- Vulnerable dependencies
- Application misconfiguration
- Logic flaws

Testing of systems not owned by the client requires clear authorization.

EXISTING PROJECTS

We can take over or continue existing projects.

Typical work includes:

- Fixing broken applications
- Resolving build errors
- Backend debugging
- Frontend debugging
- Database fixes
- Adding new functionality
- Code cleanup
- Refactoring
- Security improvements
- Performance improvements
- Test implementation
- Deployment preparation

Private repositories can be reviewed under agreed scope.

TECHNOLOGIES

Code Next.js

React

TypeScript

JavaScript

Node.js

Python

.NET

PHP
PostgreSQL
PostGIS
REST APIs
WebSockets
Linux
Docker
Git / GitHub
Cloudflare

Other technologies can be discussed depending on the project.

PROJECT REQUESTS

When contacting us, include as much of the following as possible:

- Short project description
- Existing technology stack
- Required functionality
- Current issues, if applicable
- Repository availability
- Expected timeframe
- Approximate budget

Larger projects can be divided into milestones.
