Thread: [Cerebus RAT question](#)

fighter_15 - September 26, 2010, 8:49 am

I created a server and ran the test on sandbox and it worked. However I tried opening the server on several other computers and everything went fine except no servers ever show up on cerebus. It still says 0 servers online. What could I be doing wrong?

Sage Mode - September 26, 2010, 10:22 am

Please answer the following:

1. Do you have a Static or Dynamic IP?
2. Did you portforward correctly?
3. Do the other computers have an Anti-Virus or Firewall enabled?

kylehaswings - September 26, 2010, 10:27 am

Have you tried crypting the file? If so you might have corrupted your file.

hemescool - September 26, 2010, 10:29 am

just crypt ur server and spread:)

Zpirit - September 26, 2010, 10:53 am

Probably nit crypted, run the server (be sure to make the settings to not install) and tureoff AV , should work then. ;)

1337nub - September 26, 2010, 12:59 pm

same problem :(

too short

fighter_15 - September 26, 2010, 2:19 pm

No static or dynamic IP, I'm not sure if I port forwarded correctly, what is the correct way to do it? The other computers don't have an AV or firewall.

Xycon - September 26, 2010, 5:16 pm

there is no correct way, it dpeends on what router/modem you have
you can check if your ports are open on
<http://www.canyouseeme.org/>
and
<http://portforward.com/help/portcheck.htm>
use both of them for more accuracy as they are sometimes wrong

fighter_15 - September 26, 2010, 7:29 pm

It says that the port I'm trying to use is blocked or in use. What should I do from here?

dugidox - September 26, 2010, 7:39 pm

Then you must open that port in your router...

Go here <http://portforward.com/>, choose your router type and begin or just say here router type i'll make screen tut for you

Wise - *September 26, 2010, 7:50 pm*

Make sure you point the DNS to your IP if it is not one of your computers, if it is point it to the ip address in your router for your computer.
