Thread: [C# Simple ASCII encoding](#)

ubbelol - October 3, 2010, 5:52 am

I love browsing through my old projects. I found this little encoding function i made to turn strings into ASCII values.

But please note that when trying to use this function don't use "advanced" chars (characters with an ascii value > 999) as the function can't handle them (it's easily modified though if you need it)

Basically what it does is check if the value is under 100, if it is it formats the value like "9(ascii #)" so it can be read in the decode function. I don't know what this could be used for but maybe for your strings in stubs?

Encode:

<http://pastie.org/1196502>

Decode:

<http://pastie.org/1196504>

Example usage:

```
Code string str = "abc";  
str = encodestr(str); // "str" is now holding "997998999"  
[IMG]http://i350.photobucket.com/albums/q408/ubbe12/ascii.gif[IMG]
```

This is a nice little snippet :)

I can use this for something, possibly. Perfect timing though ;)

On another note : Get on msn ! :D

Nice little encryption . I may use this in my project.

Thanks for share.
