UnHackMe allows you to detect and remove a new generation of Trojan programs ? invisible Trojans. UnHackMe is a very useful security utility for your operating system. They are called ?rootkit? A rootkit is a collection of programs that a hacker uses to mask intrusion and obtain administrator-level access to a computer or computer network. The intruder installs a rootkit on a computer using a user action or by exploiting a known vulnerability or cracking a password. The rootkit installs a backdoor giving the hacker a full control of the computer.

Your antivirus could not detect such programs because they use compression and encryption of its files. The sample software is Hacker Defender rootkit
