Code

I know it sucks, but whatever.

Someone will find this useful.

Before some flaming starts or whatever, it gets the file paths. I was using Process.Start as an example.

You don't need the

Code if(args.lengt < 2)
part, just foreach

Why that if you can only select them and press Enter?

Here come these comments.

This is just an example. Drag and run can be used say if your app edits text or something like that, the user does not have to run the app to open the file. Instead they can drag and drop over it then it'll do whatever.
