C# UDP Example

Hey guys, so, once again I threw together some code for you. Its a bit sloppy and there are a few bad programming habits shown along with the code so don't rage over it =p.

This is a basic UDP "flood" example. It uses a background worker and connects and then sends data. It works on a loop and you are able to pick the time.

Along with sending the data it will show how much data has been sent inside of a textBox. There is also an expand button that will expand the form and show a listBox with some neat little logs.

[IMG]http://i56.[censored].com/263atro.jpg[/IMG]

Conclusion:

I hope someone out there can find some use for this. Maybe someone is working on a DDoS client and they can implement this!

Thanks.

Well, It really isn't worth encrypting. Also, sure. I'll throw together a vb one and post it here in a little bit.
