Thread: [\[TUT\]How to set up iStealer 6.0 Legends\[TUT\]](#)

Shannon R. - November 28, 2010, 12:06 am

First of all, if you aren't able to read or, don't want to read something that is long, then close this now.

I am not uploading screenshots because I don't want, no other reason, just because I don't want to. If you don't like that, then also leave.

Also, if you whinge about it being such an "old" version, then, i don't care either.

Steps:

1. Firstly you will need to set up webhosting, there are plenty of free webhosts around, some will ban you though so you need to make sure you get a good one. I currently using SPAM and still have not been banned (2 months).

[SPAM](#)

2. Once you have signed up to your webhost and confirmed your account and everything, you need to download iStealer.

[Download iStealer 6.0 Legends](#)

3. Once you've downloaded that, you need to locate the "PHP Logger" folder and once in that, open index.php in a text editor. When you open it, you will see it has stuff that you need to configure, these being your database name, database password, database username etc etc, you also need to enter what username and password you would like to use, to see your logs.

4. Once all that is configured, you need to upload it to the host you signed up to earlier, simply go to the file manager and upload under the public_html folder. Upload both the index.php and style.css

To access your index.php you need to go to, www.yoursitenamehere.com/index.php it will then prompt a username and password, the ones you defined earlier.

5. Now you need to open the iStealer program that you downloaded you need to enter the home page address from your webhost, www.yoursitenamehere.com/index.php, you can press "Test" just to make sure it's working, if it says it is correctly working, then you can go ahead and press "Build".

Once you've pressed build it will require you to save it somewhere. Just save it somewhere you can remember.

6. The file you just created is the file you will be spreading, everytime somebody runs it, you will get a log on your index.php page with their passwords recorded.

Additional Steps:

You can crypt your file to make it fully FUD (fully undetectable) so you have less chance of getting caught, and more chance of getting your victims to run it.

I hope this tutorial helped you. Enjoy!

UnknownZHacker - November 28, 2010, 3:41 am

Nice Work This Will Be Useful For Noobs Here. ;)

Azido - November 28, 2010, 3:45 am

Good tutorial, but 6.3 is on the Market.

6.3 got more features.

Shannon R. - November 28, 2010, 4:21 am

Please read the first post .voGe.

Fallenbot - November 28, 2010, 4:26 am

If you could add some screen shots it would be much easier,thank you mate.

Inphex - November 28, 2010, 4:29 am

Yeah, screenies would make it easier but still overall a good tutorial.

Well done.

iDuL - November 28, 2010, 4:30 am

This tutorial would be alot more helpful if you posted pictures.

Good post anyways.

Shannon R. - November 28, 2010, 9:14 pm

Yeah I know, but I really can't be bothered.
