Thread: [\[vb.net\] make simple program which enables something in program](#)

skxprive - December 17, 2010, 8:57 am

Hey

Ive got a program which enables and disables a rule (connection rule).

Don't know how to make in vb.net a program which disables the rule without clicking on it; because now: right mouse and click on "disable rule"

or after it click "enable rule"

When I click on hotkey on keyboard, and the program enables/disables it , it would be better

Btw program is softperfect bandwidth manager

Deceptive - December 17, 2010, 9:45 am

You're making no sense, please explain in detail with correct grammar so I can understand at least one thing in your post.

m_t_h - December 17, 2010, 9:51 am

what on earth r u talking about

skxprive - December 17, 2010, 9:53 am

Look in that program, I made a connection rule.

I can use rightmouse and after click on the "menu": "enable rule"

or when it is enabled: "disable rule"

But I don't want to click on it, but want wit a keyboard hotkey for example "g"-hotkey.

The problem is how to do this, that it enables it with that hotkey.

m_t_h - December 17, 2010, 9:56 am

what connection rule? -.-

oh you want hotkeys...

go on youtube and search for: "hotkeys in vb"

:)

skxprive - December 17, 2010, 9:57 am

Yes hotkeys is no problem, But the problem is how to do the action: "Enable Rule"

the rule is just about download/uploadspeed.

The-One - December 17, 2010, 10:16 am

Are you talking about a plugin system?

skxprive - December 17, 2010, 10:20 am

(Dec 17, 2010 11:16 AM)The-One Wrote: [\[CITE\]](#) Are you talking about a plugin system?

Don't know,

When using the hotkey, it should enable rule

But normally to enable rule: You should click-right on it and after choose enable rule of the list

Pulser - December 17, 2010, 10:48 am

You want to enable something with a hotkey?

```
Code if(E.KeyCode == Keys.G)
{
    Someshit.Enabled = true;
}
```

#cn - December 17, 2010, 11:11 am

He wants to make a program so that when he presses a hotkey, it edits the setting for another program and vice versa.

I would help you OP but I have no idea on how to do this :/ Sorry

TraptCode - December 17, 2010, 11:11 am

Ok, so you need to start off by finding the window class type. Spy++ will do that for you.
Second, you want to declare your APIs.

```
Code Private Declare Function FindWindowExA lib "user32" (ByVal Parent as IntPtr, ByVal
ChildAfter as IntPtr, Byval Classname as String, ByVal WindowText as String) as IntPtr
Private Declare Function FindWindowA lib "user32" (ByVal Classname as String, ByVal
WindowText as String) as IntPtr
Private Declare Function SendMessageA lib "user32" (ByVal hwnd as IntPtr, Byval Message as
Integer, ByVal WParam as Integer, Byval lParam as String) as Integer
Private Declare Function GetAsyncKeyState lib "user32" (ByVal Hotkey as Integer) as Integer
Dim ToggleBoolean as Boolean = False
Now in a timer, with the interval set to 1, you want to do this.
```

```
Code Public Sub Timer_Tick
Dim Hotkey as Boolean
Hotkey = GetAsyncKeyState(Keys.F12) 'You can change f12 to whatever
If Hotkey = True then
If Toggle = True Then
Dim Hwnd as Integer
Dim Child as Integer
FindWindowA("TheClassNameYouFound", vbnullstring)
'Using SendMessage, find a message to work with context menus.
Toggle = False
End If
Else
Toggle = True
End If
End Sub
```

Thanks very much now I will try it with Spy

TraptCode - December 17, 2010, 12:54 pm

Here is a list I uploaded for you, this has a huge amount of values you can try sendmessage with.

http://ha.zard0.us/_/showthread.php?162-A-huge-list-of-SendMessage-Values&p=206

skxprive - December 21, 2010, 12:39 pm

Trapcode tried to help me, it is not working, because its not a direct checkbox, but a "rightclick, after click on a menu"

So Maybe another solution: Putting the program on: But deactivated it somehow .. and when needed activate it with a hotlink
Don't know if this is possible

Ag3nt - December 21, 2010, 12:50 pm

Store the programs settings in a text file, edit the text file.

skxprive - December 21, 2010, 1:26 pm

(Dec 21, 2010 01:50 PM)Gov Wrote: [\[CITE\]](#) Store the programs settings in a text file, edit the text file.
I tried that, It does this automatically .. but it only needs to import the text file once.. when editing or deleting it .. the program still works

skxprive - December 22, 2010, 7:38 am

this idea is good, or any other ideas?

edit: the idea of deactivating it is notpossible, I couldnt find anything about it

skxprive - December 23, 2010, 7:32 am

looks like no-one has the solution
