Thread: [\[Crypter\] Wanna make a Crypter \[/Crypter\]](#)

Override - January 8, 2011, 3:15 pm

Ok guys, here's da deal.

I want to make a crypter that will crypt at 1024 bytes, and after that if I get the knowledge, I will make a 2048 bytes. Can you please give me THE BASIC that true crypt does? And how does that work?

Thank you.

Thank you, but not exactly what I was looking for.

May I please have a tutorial with the basics?

I was looking around and nothing worked.

Thank you,

OverRider.

Use 'Search' i've seen tutorials like.

How to make your own FUD Crypter with VB (Visual Basic)

Thank you again, but I do not want to crypt a RAT.

I want to crypt like True-Crypt, A WHOLE hard drive.

I am sorry if there is some misunderstanding.

Thank you.

Any Ideas?

Why don't you use true-crypt? it does the job.

Done a wee search can't find and tutorials or sources for that

1. Master the Basics of C#:

- Familiarize yourself with C# syntax, data types, variables, and control structures.
- Learn about classes, objects, and inheritance to build robust and flexible crypter programs.

2. Encryption Techniques:

- Utilize strong encryption algorithms like AES or RSA to protect your payloads.
- Implement encryption functions to secure the communication between your crypter and the payload.

3. Obfuscation Methods:

- Employ code obfuscation techniques to make your crypter difficult to reverse-engineer.
- Use tools like ConfuserEx or Dotfuscator to obfuscate your code and hinder analysis.

4. Anti-Antivirus Evasion:

- Study antivirus software detection mechanisms to understand their weaknesses.
- Employ runtime manipulation techniques, such as API hooking or code injection, to bypass antivirus scans.

5. Polymorphism and Metamorphism:

- Implement polymorphic techniques to generate unique variants of your crypter.
- Use metamorphic engines to automatically modify the crypter's code while preserving functionality.
