Important : this tool doesn't crack the passwords, it bypasses the passwords.

It takes only few seconds...on Windows OS just put any pass you want and it works!!!

!! THIS IS A FUCKIN' HOT TOOL !!

So i made a search with this tags and only one or two threads with no rep.

So if u don't know this amazing tool, with this tool on a CD or USB you can bypass every passwords admin on Linux & Windows (all versions).

Website of the author :

<http://www.piotrbania.com/all/kon-boot/>

Info :

Kon-Boot is an prototype piece of software which allows to change contents of a linux kernel (and now Windows kernel also!!!) on the fly (while booting).

In the current compilation state it allows to log into a linux system as 'root' user without typing the correct password or to elevate privileges from current user to root.

For Windows systems it allows to enter any password protected profile without any knowledge of the password.

Entire Kon-Boot was written in pure x86 assembly, using old grandpa-geezer TASM 4.0.

@sud0x3 : use ur head how do you want i see yout topic if there is not the word "kon boot" inside, i'm supposed to search for "authentification" and read all the topics.

BRAIN!

akm_is_online - July 16, 2009, 9:24 pm

? This is great, but if a computers bios is password protected, you can't make the cd/dvd drive the first in the boot order, and sadly that is the case on my schools computers, anyone know of a way to get to the bios without knowing the password?

psy_ko_mat - July 17, 2009, 11:48 am

Yeah ure right not possible, but you can reinitialize the pw of the bios, google is your friend.
