You need 2 buttons , 2 textbox and 1 openFileDialog1

Code using System;
using System.ComponentModel;
using System.IO;
using System.Windows.Forms;

```
namespace AddBytes
{
    public partial class Form1 : Form
    {
        public Form1()
        {
            InitializeComponent();
        }

        private void Form1_Load(object sender, EventArgs e)
        {

        }

        private void button1_Click(object sender, EventArgs e)
        {
            var file = File.OpenWrite(textBox1.Text);
            var siza = file.Seek(0, SeekOrigin.End);
            var size = Convert.ToInt32(textBox2.Text);
            decimal bite = size*1048576;
            while (siza < bite)
            {
                siza++;
                file.WriteByte(0);
            }
            file.Close();

            MessageBox.Show("Done !");
        }

        private void button2_Click(object sender, EventArgs e)
        {
            openFileDialog1.DefaultExt = ".exe";
            openFileDialog1.Filter = "exe files (*.exe)|*.exe";
            openFileDialog1.FilterIndex = 1;
            if (openFileDialog1.ShowDialog(this) == DialogResult.OK)
            {
```

```

        textBox1.Text = string.Empty;
        textBox1.Text = openFileDialog1.FileName;
    }
}

private void openFileDialog1_FileOk(object sender, CancelEventArgs e)
{

}

}
}Credits goes to t0fx. Enjoy. ?

It makes a file bigger by adding bytes ;-)

Is there a way you could convert this to VB.NET?
I've seen this code:

<http://www.leetcoders.org/showthread.php?tid=749&pid=4593#pid4593>

But it just makes a big mess and results in a big error.

lol

u must be some kinda retard if u cant get that working...

just fucking create a new project and the controls that the code requires then copy the fucking mehtod body from the converted code and paste it inside appropriate methdos that handles the buttons click event...if dont work then post THE ERRORS....

In English? I'm pretty sure, "if dont work", isn't right. ?

Yea. I did that. Does ABSOLUTELY NOTHING. There isn't any errors. Just, nothing.

it will do nothing, if the number you set for a size is lower than the actual size.

Well the first problem is, the OpenFileDialog doesn't open to ask which file to enlarge.

[Eprouvez] - September 18, 2009, 1:53 am

Question: Does it increase it by Bytes, Kilobytes, or...?

Thanks.

Edit:

Also, get a error saying. Try make sure you aren't dividing by zero.

This tell you all : size*1048576;

[Eprouvez] - September 18, 2009, 2:02 am

Got it working, thanks.

Btw, I'm pretty sure this post is in the wrong section? Lol.

nope. vb.net is (almost) the same as c#.

TheBlackMarket - September 18, 2009, 2:06 am

Thanks dude! thanks for sharing the code to!

Section is named : Visual Basic and .NET Framework

and C#, as VB.NET is a .NET language
it's the correct section !

Ethical Vox - September 18, 2009, 9:13 am

Yeah lol when I saw this post the first thing I was going to say is that it is easy to translate this into VB.NET but anyways good job thanks for the post!

Macadelic - October 21, 2009, 2:50 pm

Is this C# or VB.net?

Astate - September 5, 2020, 5:21 pm

Thank you so much ! I wanted to do this in c # for a long time...
I only had one code in VB so.... I test immediately ?

Dude, what the f*ck? Where did you find this thread, in a museum? It's more than 11 years old...

Stop gravedigging and also stop using crappy techniques.

Astate - September 5, 2020, 7:58 pm

Yeah you're right, i didn't really know the proper functioning here i'll fix the shit i did
