xant - January 20, 2011, 11:17 am

must be tested outside of your network, unless you type in 127.0.0.1 instead of your no-ip. Also, for blackshades only forward the TCP ports, they must be different. Try using another computer, preferably a laptop to connect to another network like a neighbors.

Sonic - January 20, 2011, 11:21 am

Maybe you set it up wrong?

jbond - January 20, 2011, 11:34 am

i have never had to put in 127.0.0.1 to test on myself it has always worked and BS ports are different has been working for months with the set up i have

xant - January 20, 2011, 12:12 pm

BlackShades uses a cSocketMaster, a Winsock API implementation if I am correct, which is much different than any other rat. It specifically says it will not connect back to you if you run it on yourself without 127.0.0.1

Thanks for help but you were all wrong the problem was a router firmware update downgraded firmware to old one now it works again

Asteriqz - January 21, 2011, 3:44 am

Im guessing its the DNS, make sure you put in 127.0.0.1:81
